I was wondering if it's at all possible to add the real military bands
to this model (you know the 200's to 300mhz range)?
I just got one and I have all the frequencies, but no capabilities.

Hello-

Just wanted to know what everyone thought of the Pro 26 from Radio Shack
and the Realistic Pro 26 from Intertan. I had the Radio Shack version
but I returned it and bought the European Realistic version. It has
continuous coverage, 25-1.3 ghz. Works great. A few questions though.

-How much should I have paid?
-I obtained it through someone else but how
difficult is it to get the European version into the
United States?
-Is this an excellent scanner, compared to what's out?
-Any other Pro 26 owners out there, European
version or American? What do you think of the P26?

Thanks,
Craig

No sh*t sherlock. Don't you think I know that J.Shima's programs aren't freeware? If you READ the message I had posted before he posted his programs, I used to have a FREEWARE dtmf decoder about 2 years ago that I got from the net. I can't find it and I was asking someone to post it, however, Shima decided to put his Shareware version on the group. So get your head out of your damned ass and start thinking. Sheesh

5. POCSAG decoder fun

Newsgroup: rec.radio.scanner
Date: 1995-10-01 00:00:00 UTC
From: arenek@cortez.its.rpi.edu
Message-ID: <44l4in$bpp@usenet.rpi.edu>
Source record: 248235

Hi. I'm sorry if some of you find this uncouth, but I just discovered a
new frequency to monitor with the POCSAG Decoder package.
I originally was listening to 158.700 Mhz. The traffic here was mostly
512Baud numeric, tone only, and voice paging.
I have no "Search" function on my scanner, so I was pretty much hit-or
miss with finding frequencies.
So, acting on a whim, I went into Radio Shack and checked out their pagers.
They used 454.450Mhz. So I tried that frequency, and most of the traffic is
1200 Baud POCSAG. There are very few 512Baud transmissions, and one or two
tone-only pagers. I found a few pages that some of you may find interesting,
should you be hesitating using this package.

>dryer to shrink them. Our next area experience is the arrival of NEXTEL
>with their digitasl trunked system (formerly MIRS "mobile integrated radio
>system"). 50+ sites in Northern Ohio should prove interesting!

A few months ago, I spoke with a former Motorola tech out of Toledo who was
helping out on the new system. He mentioned that the system was a 'mixture'
of various digital technologies, not a fully implemented and tested system.
According to him, the system was named Astro, due to the sound quality
that made everyone sound like the dog from the Jetsons!

Is the NEXTEL system going to be tested throughout Northern Ohio or just the
Cleveland area?

Later...

: Thanks in advance.
: Pat
Find a local freq guide with PL tones for your local area. You can
find the sub-audible tone on a channel by locking down a channel and
turning CTCSS on. When someone begins to transmit spin the dial till
you hear them talking again. Start at 000.0 (While there transmitting)
spin the dial and when you hear them,enter that PL tone number. Not
all agencies have PL tones,a good place to try it is on the federal
freqs (162.0-173.0)(406.0-420.0). Remember they have to be transmitting
while you spin the dial,so try and find a busy channel or spin fast.

Mike

Evening Mathew,

I appreciate this doesn't directly answer your query but the guide you
refer to was written by Howard Bornstein. You could E-Mail him at his
compuserve address which is 76174.637@compuserve.com

I'm not sure he accepts credit cards (He runs a Company Design EQ that
sell scanner 'bits & bobs) but I'm sure he would help if possible.

Get the (long in tooth) BC760XLT if you plan to add the otional
CTCSS board or use it in a car, otherwise I suggest you opt
for the BC860XLT.

I tested and reviewed a BC890XLT and BC860XLT earlier this year
in Monitoring Times magazine. The relatively low priced BC860XLT
I tested worked much better than BC890XLT. Reception on the BC890XLT
and the twin Radio Shack PRO-2036 was miserable due to intermod,
images, signals getting into the IF, etc.

: imagine the tuner in his VCR would be able to tune his satelite dish.
: I don't remember seeing a set of buttons on a VCR that would allow me
: to change the postition of the satellite, or operate the descramler.

Agreed, but then his satellite receiver would have worked again.

All you would have had to do then is explain that the VCR was not capable
of receiving the satellite signals.

He might have listened to this, as he would have graphic proof that the
system was still working - as the satellite receiver would be functiona.

I doubt if he was planning on controlling the antenna from the VCR. But,
it is possible he thought that he could receive two different satellites
on two different receivers, at the same time. I agree that there are those
who are totally clueless about such things.

The managers don't know much, either. Most of the time, they are just glorified sales droids who became managers simply because they've been there the longest (Which probably means they get $5.50 an hour instead of $5.00) Just a few months ago I had one try to sell me 50 feet of RG/58 coax for a base scanner installation. Considering the severe signal loss of this coax at UHF frequencies, I don't think that was the best choice available, do you? And his RS badge said...yup, you guessed it...STORE MANAGER!

Rafael Sa (rafaelsa@br.homeshopping.com.br) wrote:

> I have a dum question...
> I have a RS PRO-2035 scanner. I would like to know what's PRIORITY? and
> how to use it.

Just push the priority button, and find out! It's usually one channel
(usually the first channel in the first channel bank) that you do this
with. When you push the Priority button (PRI) your scanner will always
scan that channel every few seconds, no matter what other channel it
may be tuned to. If that channel has a carrier, it will go to it.
So that's what "priority" is. You designate a channel that your scanner
will always jump to, if it's in use, so it has priority over the rest.
You might do this for several reasons. The channel might be important
to you for some reason, or has some emergency significance.

> JAMES DEAN KD4USF NCZN58B@prodigy.com

It's no technical challenge to be able to store out of band
frequencies... R/S is trying to avoid getting caught up in
the sale of Amateur equipment that can be perceived as illegal.
Their HTX-100 10 meter rig and HTX-202 2M HT where "Ham Only"
(The HTX-100 had USB/CW only...unworthy of CB use and the 202
does not go out-of-band at all.) The HTX-212 reluctantly crosses
this line...you can see that there are still limitations (no
out-of-band store or TX).

I'm a firm believer in using the "right tools for the job"...
I have Amateur Radio equipment for use in the Ham bands
and a scanner for LISTENING from DC to light.
You shouldn't incriminate R/S for selling Amateur equipment that
doesn't do what it is not meant to (It's a HAM transsciever, not a
scanner!).
It's nice for some to have the ability to use their Ham rig to listen
outside of the band but I personally don't like to substitute front-end
rejection for that privledge. I use my scanner for that and suffer
little or no intermod on my 2m Ham rig.

...and now, back to scanners...

Whenever it will be, I don't think it will be for a long time. Maybe in the next century. But as far as the next few years, analog phones will still be in the huge majority. Reason why, these are the phones that retailers push, and sell like crazy, especially with new cellphone customers. To get new cellphone customers service providers/retailers are literally giving away the analog cellphones, with a one to two year service commitment. They aren't doing that with the digital models, at least where I live in California. They're still up in the $300 to $400+ price range, in addition to what you have to pay for cellular service. That's a lot of money for most people, especially for first time cellular users. Until these prices come down close to where digital phones are, analog cellular service will continue to grow, and certainly not decrease.
As soon as you start seeing a decrease in analog cellular phone subscribers, maybe then we might be able to guess the phase-out of analog service. But providers now, certainly are in no rush to do this, even though digital is much more efficient, and cheaper with greater capacity, in the long run.

>
>Hello, I own one of these beasts. It works quite nicely. It scambles the signal
>between the base and the handset. This prevents scanners from listening to
>you.

I also own one of these beasts and they do work on the regular
cordless frequecies (ie 46.61-46.98 or whatever) and they can be picked up
the only thing is when a scanner listens in they hear the voices scrambled.
The highs are lows and lows are highs. No sane person would be able to
stand listening to it for more than 5 seconds so it's safe. The Motorala's
also prevent other cordless phones from dialing from you're phone, so no
unexpected 1-900 numbers. Hope this helps..

[last changed 02-May-95]

Changes preceeded by "|". Please e-mail corrections and additions to me.

The latest version of this file can be accessed via anonymous ftp to
agora.rdrop.com in /pub/users/billmc/fcc_sources or via my web page at:
http://www.rdrop.com/~billmc

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists.
The FCC master contains a wealth of data about every non-government license
in the United States (over three million records). Most of the sources
listed contain a subset of this data, although a few contain all or nearly
all of it. Government licenses are not administered by the FCC, and the
data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider
forming a co-op of people in your area to share the cost. As far as I can
tell, this is legal since the information is in the public domain.
However, the software supplied to view or manipulate the data is usually
copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major
cities cost extra.) A 70-mile search costs $178. The data is provided on
floppy disks and is available in ASCII columnar and comma-delimited
formats.

CET does not provide data for licenses that do not contain specific
geographic coordinates (i.e., mobile-only systems) or specific operating
frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of
the 30-mile radius. I calculated mine from a USGS topographic map I
obtained at a local nautical supply store. Alternatively, you can obtain
the coordinates for your town from the University of Michigan's geographic
name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For
my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $103, and the mapping version is $173.

Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the Frequency Set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state,

covering all services and all frequencies. Data is updated approximately every six months (last update was Dec 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

Dean Wright <dwright@awis.auburn.edu> wrote:

>I haven't seen anyone yet at RS know there ass from a hole
>in the ground!!!!!!!!

Now Dean, I suppose you know a lot about assholes.....

Maybe I'll go back to work at the local Radio Shaft here and you can come buy something from me. I'll be happy to explain the difference between your ass and a hole in the ground.

Anyway...I'll agree there are some stupid sales people at the Shack, especially near Christmas. Here's a little story to share:

While browsing the scanner section at a RS a few years back a salesman asked me if I was interested in the CBs. I pointed to the Pro-35 and asked what it did. He said it was a police CB, and went on to explain how I could use the nice array of neat little buttons to program in police channels so I could talk directly to the police in an emergency. I thought I'd burst his bubble and ask how you could talk as there seemed to be no transmit button, but the yahoo got the last word as he thoughtfully said..."Oh- its voice activated!" (Yes _I_ know that should be actuated, Dean.)

His manager heard about it on the phone later that day.

You've got questions, we'll call our manager.......

Source record: 248376

The information from Don is basically very correct. The system is a Motorola ASTRO digital trunked radio system. The whole gestation of the project took many years with many consultants (internal and external to the city and the potential vendors) and city meetings dealing with the real requirements for "all" of the City departments from public safety to services. The system has seven towers located around Cuyahoga County, does provide a lot of redundancy and is now running for most of the City users. Everyhting I have heard so far is that the system is operating very well. The cost was $44 million dollars. The portables are a digital astro version of the SABER II which still could use a little time in the dryer to shrink them. Our next area experience is the arrival of NEXTEL with their digitasl trunked system (formerly MIRS "mobile integrated radio system"). 50+ sites in Northern Ohio should prove interesting!

As far as the monitoring of the new Cleveland system goes Don is also correct that no one cares that the casual listener or the press cannot monitor the police, etc....but then whats the point of everyone knowing what the police are up to when they dont wear a badge and perform the duties? The press in cleveland will probably be allowed partial access to the primary dispatch channels. i guess its important to keep the pictures in the paper interesting and the nightly news live reports going so that the news people have something to do with all of that fancy ENG stuff they've bought over the last few years.

Not only that - many of the scanner laws which exempt amateurs are
written to allow tranceivers which also happen to have wide receive
coverage. Some laws state this explicitly while other laws just say
'amateur equipment'. It would be risky expecting to be scanner
legal just by having an amateur license...

I have (2) scanners for sale. Both are cellular ready. Both were purchased a little over a year ago. The first is a Pro-2006. It is in new condition and was barely used. I have the box and manual for it-(it's in the box). The second is a Bearcat 2500XLT handheld receiver. It is also in new condition. I have the original box and manual for it as well as a belt clip, harness, car adaptor, and an extra antenna-this scanner is very fast. They are, as I said earlier, both cellular ready and very modifiable. I will take $450 for both . I will only sell them together. Prefer San Diego prospective buyers but will respond to anyone in the U.S.. Please respond via e-mail.

Not quite. I don't have first hand knowledge of all carriers but I
know how some of them operate...

The frequency assignments are on a specific plan, normally grouped
in channel sets, but the specification is determined by the carrier
so they can differ from system to system.

When a system is retuned, they don't move frequencies around
individually, rather they move channel sets (or channel groups -
whatever the carrier calls them).

From: footage@panix.com
Message-ID: <44prtf$cmh@panix.com>
Source record: 248188

I had my Motorola Minitor II recrystalled and modified to scan by
Com-Tech Electronics in Renssaeler, NY. Their phone:
800 344-4896
518 283-0958
They also sell used Minitors.
The mod (which allows a 2-frequency unit to scan between F-1 and F-2)
works well unless battery voltage is down, in which case F-2 cannot be
received.

These are great, durable, little 1 or 2 channel receivers. But bear in
mind they have no external antenna and are good for local or metro area
reception only. Don't try them for simplex stations; stick to repeaters
or strong bases.

61. Re: Small 150MHz receiver? Motorola pager?

Newsgroup: rec.radio.scanner
Date: 1995-10-02 00:00:00 UTC
From: engine270@aol.com
Message-ID: <44psp5$hnq@newsbf02.news.aol.com>
Source record: 248190

The Motorola Minitor series receives are not pagers but single channel UHF or VHF receivers and are crystal controlled and tuned to a specific frequency. The operate on two nicad batteries and are no larger than a pack of cigarettes. You can get a "drop-in" battery charger or if available a "drop-in" amplified charger. Either charger will charge up a spare set of batteries.

You might try:

G&G communications
9274 Glenwood Drive
LeRoy, NY 14482
Phone 716-768-8151

or

McManus Communications
400 North 5th Street
Blytheville, AR 72315
501-763-6250

A good operating unit with the crystal, reed and batteries may run about $150.00 plus charger.

The scanner had probably been without power and had "test frequencies"
loaded. I know of no modification that will allow the 800MHz band to
be received in the PRO-38.

Much of the 900MHz cordless phone activity is using a technology know as spread spectrum. The best you are likely to hear is a slight rise in noise level. It takes special equipment to receive spread spectrum. The signal is constantly hopping around so you are not going to hear it. Those not using spread spectrum, are using digital modes. Either way, your not going to hear them with your "off the shelf" scanner.

I don't think pleading will do much good. Since the BCT7 is a newer unit, it
falls under the FCC rules which say it can't be easily modified to restore
the whole 800 MHz band. At least here in the U.S. Sorry.

Hi

I live in Toronto Canada. I figured that was important to say as I rarely can figure where people at sending messages from...anyways. I built the pogsag "cable" and it works great. I am able to receive a bunch of numbers...but so what. I get a pager id number and then a phone number. The software times out after 5 minutes but again...so what? Am I missing something here??? I can look at this stuff for only so long. Am I supposed to receive ASCII text? Should i find another channel to monitor?

I didn't bother using the lower half of the circuit connected to pins 20,2 and 4. I gathered these were just to fool the comm port into thinking it has a connection. to my computer I only used pins 5 and 7 from the origional schmatic but I also parallelled pin 3 to pin 5 just in case something else happened to come across at a different baud rate. I figured I could use my terminal emulator to view that stuff.

If I am way off base with my use of this pogsag stuff will somebody please give me a swat on the side of the head and try to clue me in!

Thanks
Barry

The resrtrictions on electronic devices would still apply to aviation
service hand held tranceivers.

None of HT tranceivers, that I know, carry any type of FAA approval.
Some radio equipment, and just about all equipment installed in an
airliner, meet Technical Standard Orders (TSOs) set by the FAA. Those
of us that fly private planes (not for hire) are not required to use
TSO'd radio equipment. Even if the hand held was TSO'd, the pilot in
command can restrict it's use by a passenger (IAW FAR 91.21).

Any hand held aviation tranceiver sold for use in the US has a type
accpetance from the FCC. But that still doesn't give any authority
to use it on board.

BTW - it would be a pretty expensive way to just listen in air
traffic. Purchased new, a _basic_ hand held would run you over $300.
And all they do is VHF. Any modification for wider coverage (and you
wouldn't get much more out of it anayway) would void the type
acceptance and kill any resale value it may have.

Curtis Wheeler - Pleasanton, CA

The same for every vendor????? Are you reading this from some text book, or have you worked with service providers throughout the United States for the past 3 years like me?

Please check your sources before making omniscient statements like these. After having dealt with service providers in the field for 3 years (it's my job, not my hobby) I have NEVER seen the same frequency assignments between service providers. I don't know where you read that, but it is absolutely wrong.

Well, it would seem so. But don't forget about things like
"undetectable" laser speed guns, "unbreakable" satalite codes,
and such. If its possible to encode, it is possible to decode.
There will be a way.

I found that my 890xlt is extremely sensitive and the unit works best with the supplied antenna. An attenuator option may have resolved some of the intermod problems. I use both the 890 and 9000xlt, and the 890 complements the 9000 very well due to all the images I get in the 30-50 Mhz range on the 9000 that surprisingly don't exist on the 890.

Bill Funk is absolutely correct!!! I am a professional truck driver and, tho most people don't know it, radar detectors have been illegal in commercial trucks for some time now. [In N.C. the fine starts @ $1000/ first offense, I've been told]

In all honesty, the major function of a radar detector any more is to tell you when to pull over; Unlesss you're in a fair amount of traffic, and someone ahead of you gets *shot*, you CANNOT react fast enough to slow down! [<.1 sec capture time for radar]. A really good, sensitive detector will help a lot here. Personally, I've used a Passport [one of the original ones] for several years and had great luck. Once in Texas, it started beeping occasionally. I drove for nearly 12 (yes, TWELVE) miles before I met a Texas trooper coming _toward_ me. BTW, radar detectors are illegal only in Virginia, the D of C, and everywhere in Canada. [Don't know about other countries].

Beartracker was a good *concept* but has proven impractical. With a three-mile range, it will pick up a LEO _way_ off on a side road somewhere. And of course, like BF says, they only pick up IF something is being transmitted. So unless you just want to wear out your

brakes prematurely, I wouldn't recommend one. [Sorry,
Uniden!]

A conventional scanner is, indeed, legal for mobile use in
places and not in others, if it is capable of receiving police
frequencies. A bit of advice here: I used a scanner for over
2 years in my truck, back when I had a *fast* truck, and
there was ONE occasion when it MIGHT have kept me from
getting a ticket. But they are fun to listen to, especially on a
long, boring trip. And the chances of you getting *caught*
using one are slim to none if you don't advertise the fact
that you have it. A glass-mount antenna that looks like a
cellular antenna works well for inconspicuity.

A CB radio, will, indeed, be your best bet, aside from the
fact that you can also find out about road conditions, traffic
jams and ways around them, accidents, lane closures, and
all sorts of necessary travelers' info. You can also get help
sent if you're broke down, or need assistance in any way.
Note: many truckers won't stop and give you a lift because
they'll lose their job for *unauthorized passengers*, but
most _will_ make a phone call for you or send a state
patrol car to help you.

Anyway, that's MY advice, based on about thirteen years
of trucking experience. Good Luck on your trip; drive
safely[esp. around *big trucks*]; and most of all, ENJOY
THE RIDE!

>does it?

Seems to me that some genius out there could figure a way to
cause a good radar detector to initiate the radar gun. That way, the
cop's radar would be TOTALLY confused while trying to get a lock
on your vehicle. But it would likely be illegal. BTW, have you
looked closely at any Greyhound busses? They have a
low-powered radar mounted on the rear for some reason. It will set
off radar detectors quite handily.

If you have the money, Motorola made receivers from several of their pagers.
I had one but surely that model is out of production. Check with your
local rep. Otherwise, it will be a difficult modification for you to
re-build an old pager to include the squelch.

>If not anyone got anything to trade?

The only way to "unblock" the cellular frequencies in the PRO-2035 is
to change the Logic Board (the small board attached to the display). If you
want info on this, send a message to info@javiaton.demon.co.uk

91. Re: portable scanner range

Newsgroup: rec.radio.scanner
Date: 1995-10-02 00:00:00 UTC
From: chmsam@aol.com
Message-ID: <44p25o$8qq@newsbf02.news.aol.com>
Source record: 248275

Range of reception depends on several things. Most of the frequencies you'll be listening to are "line of sight." That means that the radio waves don't "bounce" off the atmosphere as others might. They travel in a straight line radiating out from the transmitter. Therefore, distance of reception depends upon terrain. Also, the more buildings you have in your area, the more the range is limited.

Assuming you live in a flat land, low density area you might expect reception from anywhere from 25 to 40 miles, depending on the strength of the transmitter and the quality of your scanner. And just when you thought this was getting easy, the type of antenna complicates things.

The rubber ducky antenna on most scanners is OK. There are several firms that manufacture improved antennas for handheld scanners, both rubber duckies and whips (Ooooo, kinky! <g>). Ahem, well, at any rate, whips need to be adjusted depending on what frequency you want to hear. You extend so much of a whip for frequency A, and so much for frequency B. In my area, there are channels in the 40 MHz, 155-159 MHz, and 460 MHz bands. That's a lot of adjusting.

A discone is an antenna that looks like an umbrella with the cover ripped off. They are not what I'd recommend for a handheld scanner, but work well for base units, and they work over a broad range of frequencies. However, the best reception you can get for a frequency range (say, 460 MHz) is from an antenna made for that frequency range, mounted outside, high, and away from power lines and telephone lines. This will improve what you hear and usually the number of stations you hear as well. This means getting up on the roof or mounting it on a mast.

A few notes: be very careful of power lines, check your zoning laws if you put up a mast or tower, and never get up higher than you want to fall. NEVER work within twice the distance you think anything will ever come near a power line. High voltage transmission lines can and will arc without contact. The voltage on the lines near a transformer that will feed your house current can be thousands of volts. Every year experienced radio operators get fatally zapped. Be much more careful than you think you need to be (this is one case where it pays to listen to your wife when shes asks if your getting too close to the lines <g>). Get someone to help you if you're going up on the roof. A little bit of wind can really move you and the antenna around a lot. And you always need a second pair of hands.

Some areas restrict what kind of antenna towers you can put up. Ask your zoning board or check the library before you get started. Also, some condo associations and the like refuse to grant you a waiver in your agreement to put up an antenna. However there are antennas designed to look like plumbing ventilation tubes.

Whatever you put up, be careful and learn how to use a ladder properly. Ladders are much steadier moveed just a few more feet away from the

structure. I have not met too many people who really know how to safely use a ladder. Learn how. It takes less time than the emergency room visit.

One last thing to mention: amplifiers. If you live in a metropolitan area, you probably do not want to use a signal amplifier. It will amplify the noise you already have too much of anyway. These devices are pretty good for rural areas, though. Be sure to find one that has low noise. For handhelds, Radio Shack makes an amplified antenna for portable TVs that I've had pretty good luck with. And it's pretty cheap.

I live about thirty miles from a metropolitan area. There's farm country around me. I can pick up anything from the nearby city and for about four counties around me. I use a discone mounted indoors (too steep a pitch on the roof for me).

I hope this helps, and whatever you do, if you're working outside with an antenna, be careful!

You may want to look for a Motorola "Minitor" pager. It has been out long enough that many Fire
Departments, Law Enforcement Depts., etc. are upgrading to newer type units.

Most Minitors have a switch on the top to alow the monitoring of over-the-air traffic. There is no external
squelch control, but in most instances it is not really necessary.

Another pager would be the "Senator" series from Sonar Radio. Good unit with a monitor mode.

95. AR1000 reception problems

Newsgroup: rec.radio.scanner
Date: 1995-10-02 00:00:00 UTC
From: dcarroll@onramp.net
Message-ID: <44pejh$ahf@news.onramp.net>
Source record: 248279

I have an AR1000 that gets poor reception in the air band (ie: 118-130 MHz). I live less than 2 miles from DFW airport and I am getting reception as though I lived 30 miles away. I am getting a lot of "trash" and humm. Every time I am listening to a transmission in this band it sounds like the broadcaster is in a helicopter, not because they may literally be in a helicopter, but because the noise is a constant pulsing hum. Squelch will not even get rid of it. Any ideas? Can these receivers go out of tolerance?

Thanks!

I got this program and tried it out... I can't get it to work on my system.. while I did get the shareware stuff that was also uploaded to work fine.... any ideas??

I run a 486/66... do I need to slow it down to 20 mhz? would that help?

Thanks

Chad Baker

Cellular One is still pushing TDMA digital very hard in northern
California. There latest deal gives you unlimited weekend calls
with no airtime charges. It seems to be drawing in quite a few
customers. They are TDMA.

> Reducing the wave width and adding more channels to about 15 fold looks like
> the way. They're experimenting with it in Seattle now on two freq's. Only
> mod needed for the phone is more channels and a final amp for the audio.

"Time Splicing"? Are you talking about TDMA, which one might call
time slicing? It isn't great but it does work. It's use is limited.

I am not sure what you mean by "reducing the wave width". Going to
NAMPS wouldn't give you a 15 fold increase in capacity. I beleive
15 times the capacity is what is anticipated for CDMA. But that's a
whole lot different than just narrowing the bandwidth of the channels.
CDMA is akin to spread spectrum technology.

GTE Mobilnet is supposed to be rolling out CDMA next year sometime in
northern California.

You guys are talking apples and oranges.

The frequency range is set by the FCC. So the frequencies available to all carriers are the same (with the exception that there
will be one carrier assigned the wireline frequency range and the other will have the non-wireline frequency range). However
each carrier can arrange the frequencies any way they want. As an example, I knew all the frequencies used by the cell that
happens to cover the area I live in. A few months later I noticed that something had changed. I pulled out my cell phone which
displays channel numbers and figured out that all of the frequencies had been changed. For some reason they decided to
switch things around - probably because a new cell was added someplace and the switch was necessary to make it all fit.

> that made everyone sound like the dog from the Jetsons!

Sounds like he fed you a line. I am not sure of how the name was
determined, but Astro's digital audio quality is actually very good.
And since it is digital, it can be encrypted on digitized without
affecting the audio quality. Unlike Securenet which makes voices
a bit robotic.

Mixing the technology is what Astro does well. It is a very flexible
system. It allows for anolog and digital operation so a user can
be on a new digital system and go back to an analog system by just
just changing channels.

I can't belive my eyes...I was in the middle of programming a freq into channel 98 when all of a sudden, the display froze. The entire keyboard was "locked"-none of the keys responded. I then power cycled and after that, the display is blank. Subsequent power cycle does not help-the display is blank, keyboard locked. The "light" button still works-LCD lighted up. I thought it was the battery - wrong...

What's next? Any suggestion? Should I take it back to RS and have them deal with it? What do you think?

Another way to say this is that there is a pool of frequencies
used by all carriers. Carriers can assign these frequencies
into any groups they want and can also choose not to use
them all, but they can not use frequencies outside the range
specified by the FCC.

>Curtis Wheeler - Pleasanton, CA

This is the first time I ever heard someone refer to light as radio
waves!

Here's my analogy -- radios waves trespassing on MY property are fair
game for me to demodulate. Likewise, photons trespassing on MY
property are fair game to be collected and magnified -- i.e,
binoculars are o.k. Sounds waves, trespassing on MY property have the
right to be listened to -- do you suggest I plug my ears if my
neighbors are having an argument?

If I'm on MY property I'm not harming anyone. If I trespass on my
neighbor's property, that's a different story. I'm not talking about
what's legal here, I'm talking about what makes rational sense.

Do cordless phone frequencies differ for different parts of the world? I'm in New Zealand and I have a Panasonic cordless phone/answering machine and I pick it up on 40.375 which isn't in any of the frequency lists I've seen posted. I've programmed in the frequency lists I have seen posted and I have yet to pick up anything on them (been trying for a couple of days) at home or while driving around.

Thanks,
Paul

Bill,

You're quite right -- there's the A band and the B band, for the
non-wireline providers and the wireline providers. And that has NOT
changed since first established.

IS-54 is the standard for TDMA in North America (more precisely, it is now called IS-136 and includes the Digital Control Channel).

IS-95 is the standard for CDMA.

And you're quite right, N-AMPS is 10-kHz not 15-kHz as I orginally said. The aim was to get 3 calls up on the same 30-kHz channel (like TDMA).

>Thanks.

>Richard Reider

A dipole is equal lengths each side of Center, however 2 or more dipoles can
be parallelled from the same feed point to give multiband coverage

468/FmHz will give the length in feet of the entire element. Divide by 2 for
each side. 5616/FmHz will give the resukt in inches again divide by 2.
The length will not be overly critical in recieve applications

>detector's -
>does it?

No, it doesn't. The Ramsey kit runs on 2.5 GHz, while police radar
is typically on 10.525, 24, and 36 GHz. The Ramsey gun hasn't
set off any of my detectors.

The Ramsey gun is, IMHO, only accurate to several miles per hour, since
it drifts significantly as it warms up--in fact, on the GTEM cell's spectrum
analyzer here at work, I could watch as the pip slowly drifted as the unit
began to warm up. If someone's doing 26 in a 25 mph zone, you'll be
hard-pressed to convince me that the reading's accurate. But if the gun
registers 45 mph, you can be sure that they aren't doing 30 mph.

On a footnote, some party asked me if they could borrow it to crack
down on speeders on their parking lot--and I politely declined. *Ahem!*

>Thanks!

David,

Based upon the info you provided, here are some thoughts I have as to the problem. I too have an AOR 1000. They are not very selective. I to have had problems with the air band also. I believe alot of my problems are associated with the AOR 1000's lack of selectivity. If I am within close proximity (anything less than a million miles) of an AM broadcast station, the air band on mine is useless. However the 1000 is far and away better than the 1500 was. I had an AOR 1500 and found it to be useless as a radio reciever.

The other problem may be that you are to close to the airport. Does the airport have a VORTAC, VOR or VOR/DME nearby. The pulsing noise and interference may be from this equipment. Just a thought.

When I worked at Radio Shed. I was extressly told Radio Shack is NOT a
self service store and whenever possible you great every customer
personally. I hated this, when even now, I am a customer I resent the
snooping of the droid. I worked for 26 years for the phone company many
as a central office supervisor one of these unfortunates said "that wire
won't work on a telephone. I pulled out my telco ID card and said I've
worked for them 20 years (at that time) would you care to retract that?"
He didn't.

Just wondering.... Is that virtualy possible to make a World-Wide VHF transmition?? A transmition that can be "hear" all over the planet, let's say, in the 100-200 Mhz frequency ? Is that possible? If so, how power the transmition station will have to be? And the antenna, how tall will have to be?

JUST curious... :)

I had an AOR1000; used it to monitor air bands all of the time with great success. I live about 30 miles west of Boston's Logan airport, right along one of the flight paths, so my situation is a lot different than the one you're describing. Are you using the orginal duck antenna (which is a piece of junk)? Try using RS's $10 whip and adjusting the length...

I purchased a BCT7 last week and returned it yesterday. Needless to say=20
I was not impressed, besides the fact that I was ripped off (I paid=20
$237.99 with tax for it).. It can not do a search that you ask it to do,=
=20
and the 100 channels of memory it does have are all split up to the=20
different pre-set selections. Say 25 in private, where it will scan only=
=20
the freqs you program, 25 in police, where it will scan the 25 you=20

selected PLUS the police frequencies, etc. Its just stupid because you=20
can't set it to scan different banks of frequencies you would like it=20
to. It is missing other features like find and store, you can't just=20
enter the number of the frequency in, you have to hold the up arrow or=20
down arrow for a while until it gets there. After having it for 3 days I=
=20
knew I wanted to return it. And now I just ordered a better scanner,=20
although some may say its not (890XLT), for $5.00 more.

The TR-2400 (also sold as the Camnis HSC-050) is Nissei Electronics'
follow-up to the radios sold as the AR-1500/1500e/1500ex. They went back
to a full size case, which allows decent battery life and a better
speaker.

Compared to the AR1500 series (and the previous AR1000 series) it has
better sensitivity and a MUCH improved user interface.

My only complaint was that it seemed to leak CPU hash into the RF stage,
audible as a low-level groan in the background on some frequency ranges
(e.g. VHF hi). This meant you got more garbage in the background requiring
a higher squelch setting. The set is sensitive enough that this isn't a
fatal problem, but it is an annoyance.

There still are design deficiencies - like using an analog "clarifier" for
SSB (which means you can't store or scan SSB signal on their true
frequencies or offset).

Remember, There are no dumb questions, only dumb answers. I just hope
this is not one of those.
I have a Pro-2021 and I assume that the Priority feature is similar.
This switch, when set will cause the scanner to check the specific
channel you have specified on a regular basis regardless if it is
scanning other frequencies or actually on another frequency. Having said
that, To set the Priority on my machine to channel say 10, simply press
PROGRAM-10-PRIORITY and that's it.

Hope this helps.

From: arenek@cortez.its.rpi.edu
Message-ID: <44ru86$n3v@usenet.rpi.edu>
Source record: 248302

I'm wondering if I have one of these pagers. It's a motorola voice pager
with a drop-in charger (with space for spare battery charging also).
The belt clip is significantly larger than the Bravo's clip, and it's about
the size of a pack of cigarettes (a bit smaller, maybe).
It has two controls: a on/volume pot, and a wide button on top. Under the
button is a piece of paper with three digits typed on it.
The operation is as follows: When turned on, the pager emits a series of
three (?) beeps, then you hear watever is being transmitted on it's frequenccy
(happens to be in the 158Mhz range) If you hit the top button at this point,
the pager shuts off it's audio (presumably until a page comes in). If you
press and hold the button down after this, the pager opens up the "squelch"
again until you let go.
I'm wondering what type of signal is used to alert the pager that it should
open squelch and play the voice message? Is it a simple tone sequence?
From monitoring the frequency, it sounds as if it might be just a few tones.
If this is possible, couldn't I just play the tones specific to the pager
and get it to work (assuming I have a transmitter for 158 Mhz?)
There are devices which look like they may be tuned circuits to recognize tones
, but I'm not really all that familiar with the pager's guts (They seem like
they were probably designed with 30 year old technology).
Thanks for any help[you can provide.
-ken

Hello all:

I'm looking for the least expensive scanner (new) with a RS-232
interface. I would like to log and control the scanner with my PC
laptop. So far, the new ones that I've seen costs at least around $500, if I wanted the interface
feature.

Your help will be greatly appreciated.

Derrick

: The same for every vendor????? Are you reading this from some text
: book, or have you worked with service providers throughout the United
: States for the past 3 years like me?

I should have been more clear. There are two classes of provider, and each class has a set of frequencies that they are allocated. All vendors of a particular class will have the same frequency set.

Now, has that changed in the last few years?

: Please check your sources before making omniscient statements like
: these. After having dealt with service providers in the field for 3
: years (it's my job, not my hobby) I have NEVER seen the same frequency
: assignments between service providers. I don't know where you read

: Negative. I'm currently working with a service provider that just
: re-tuned their system after adding a few cells -- they AIN'T
: permanent.

Hm. I could see this happening for a sparcely populated area, but do not
see it occuring for a dense area - where there is no room for additional
cells. In other words, once the area is completely populated, there would
not be any reason to change the assignments - as they are designed to
minimise interference between cells.

Could be that I am wrong, but that would be counter to what I have read in
my references.

Being that you actually work in the field, where my interests are
theoretical,
I will have to bow to your immediate knowledge.

Cellular One is still pushing TDMA digital very hard in northern
California. There latest deal gives you unlimited weekend calls
with no airtime charges. It seems to be drawing in quite a few
customers. They are TDMA.

> Reducing the wave width and adding more channels to about 15 fold looks
like

Only
> mod needed for the phone is more channels and a final amp for the audio.

"Time Splicing"? Are you talking about TDMA, which one might call
time slicing? It isn't great but it does work. It's use is limited.

I am not sure what you mean by "reducing the wave width". Going to
NAMPS wouldn't give you a 15 fold increase in capacity. I beleive
15 times the capacity is what is anticipated for CDMA. But that's a
whole lot different than just narrowing the bandwidth of the channels.
CDMA is akin to spread spectrum technology.

GTE Mobilnet is supposed to be rolling out CDMA next year sometime in
northern California.

The scanner had probably been without power and had "test frequencies"
loaded. I know of no modification that will allow the 800MHz band to
be received in the PRO-38.

Re: LoJack...

It was tested here in Mass. first. Most of the towns have the antennas,
though here, they are 19"...for the 170 Mhz frequency used.

It works...our secretary had her car stolen from the parking lot at
work and they recovered it unharmed within a day using LoJack. The
company even asked her to do a radio spot for them, which she did.

When you sell the car, you can remove the LoJack "brick" and reinstall
it in your next car, as one of my friends did. They usually hide it in
a fender or trunk. It's aroud $500-600 to get it installed, but there's
usually an insurance savings.

I have an AR1000 that gets poor reception in the air band (ie: 118-130
MHz). I live less than 2 miles from DFW airport and I am getting
reception as though I lived 30 miles away. I am getting a lot of "trash"
and humm. Every time I am listening to a transmission in this band it
sounds like the broadcaster is in a helicopter, not because they may
literally be in a helicopter, but because the noise is a constant pulsing
hum. Squelch will not even get rid of it. Any ideas? Can these
receivers go out of tolerance?

Thanks!

David W. Carroll

I've found that in general, the places to check for these are in the media's
frequency allocations in the 450-451 and 455-456 MHz range (12.5 kHz channel
spacing). They also use the 161-162 range for Interruptable Foldback (IFB)
from
the studio to the field units.

Is there a FAQ out there with a listing of scanner laws by state?

I have (2) scanners for sale. Both are cellular ready. Both were
purchased a little over a year ago. The first is a Pro-2006. It is in
new condition and was barely used. I have the box and manual for
it-(it's in the box). The second is a Bearcat 2500XLT handheld
receiver. It is also in new condition. I have the original box and
manual for it as well as a belt clip, harness, car adaptor, and an
extra antenna-this scanner is very fast. They are, as I said earlier,
both cellular ready and very modifiable. I will take $450 for both . I
will only sell them together. Prefer San Diego prospective buyers but
will respond to anyone in the U.S.. Please respond via e-mail.
```

Help!!

Does anyone have the 15way pin-out connections and code to enter to turn
the NEC 7A car phone into a scanner??

If you can help, it would be much appreciated.

Mail: Hurst_M@bt-web.bt.co.uk

Thanks!!

Matt

PO's documentation is a little sparse. The design of the cable hardware is
such that you must get the volume setting just right, or it won't work.
To start, have the volume all the way down. In very small increments, raise
the volume untill you start to get a response from the program (it helps
here to have a way to hear the data stream. Maybe a second scanner, or a "Y"
connector, with one end going to the serial port, the other going to a
speaker).
As you get a response, then adjust the volume to get the least number of
errors.
A very light touch on the volume control is necessary.
Hope this helps.

Bill Funk is absolutely correct!!! I am a professional truck
driver and, tho most people don't know it, radar detectors
have been illegal in commercial trucks for some time now.
[In N.C. the fine starts @ $1000/ first offense, I've been
told]

In all honesty, the major function of a radar detector any
more is to tell you when to pull over; Unlesss you're in a
fair amount of traffic, and someone ahead of you gets
shot, you CANNOT react fast enough to slow down! [<.1
sec capture time for radar]. A really good, sensitive
detector will help a lot here. Personally, I've used a
Passport [one of the original ones] for several years and
had great luck. Once in Texas, it started beeping
occasionally. I drove for nearly 12 (yes, TWELVE) miles
before I met a Texas trooper coming _toward_ me. BTW,

radar detectors are illegal only in Virginia, the D of C, and everywhere in Canada. [Don't know about other countries].

Beartracker was a good *concept* but has proven impractical. With a three-mile range, it will pick up a LEO _way_ off on a side road somewhere. And of course, like BF says, they only pick up IF something is being transmitted. So unless you just want to wear out your brakes prematurely, I wouldn't recommend one. [Sorry, Uniden!]

A conventional scanner is, indeed, legal for mobile use in places and not in others, if it is capable of receiving police frequencies. A bit of advice here: I used a scanner for over 2 years in my truck, back when I had a *fast* truck, and there was ONE occasion when it MIGHT have kept me from getting a ticket. But they are fun to listen to, especially on a long, boring trip. And the chances of you getting *caught* using one are slim to none if you don't advertise the fact that you have it. A glass-mount antenna that looks like a cellular antenna works well for inconspicuity.

A CB radio, will, indeed, be your best bet, aside from the fact that you can also find out about road conditions, traffic jams and ways around them, accidents, lane closures, and all sorts of necessary travelers' info. You can also get help sent if you're broke down, or need assistance in any way. Note: many truckers won't stop and give you a lift because they'll lose their job for *unauthorized passengers*, but most _will_ make a phone call for you or send a state patrol car to help you.

Anyway, that's MY advice, based on about thirteen years of trucking experience. Good Luck on your trip; drive safely[esp. around *big trucks*]; and most of all, ENJOY THE RIDE!

Yeah, right. And if congresscritters pass a law saying by truck is white,
when it *looks* blue, what color is it, *really*? It's blue.
If those same congresscritters say a radiophone user has a reasonably
expectation of privacy, do they *really*? No. Just in law.
Just as my truck would still be blue, those radiophone users have no real
expectations of privacy.
Law, yes. Bad law. Any law which attempts to change physics is a bad law.

NASCAR Winston Cup Scanner Frequencies

As of September 9, 1995

The first channel listed for each driver is the last one that team was verified to have
communicated on. The #11 Brett Bodine channel no longer seems to be scrambled.
NASCAR is in the process of transitioning from one set of frequencies to another...since
they still use frequencies from both sets, they are both included here. Be advised that some
teams hop frequencies from race to race and even day to day...keep trying their different
frequencies until you find them.

Frequencies used by the media vary from race to race, the listed frequencies are those
verified to have been the last ones on which they were heard communicating. To find the
production channel for the covering media at any given event, it's recommended to use the
scanner's search mode between frequencies 450 and 470.

If your reig is an actual amateur transceiver, then the FCC has
preempted any local laws which might impact you. The FCC
premption makes no statements as to any programed frequencies
etc. The premption is strictly based on your being a ham
and that you are using a ham transceiver which happens to
have an extended receive capability.

Would never happen because of the charactaristics of VHF however if it might happen it would need about 4 quadrillion kw or something like that.

Thats why they use HF which is much easier to use to communicate over long distances.

Hi! I'm interested in getting a scanner for 120-190mhz & 400-500mhz (or whatever the ranges are) and dunno which one to get...I live in Canada and don't want to order from the states (Xchange rate, duty tax, etc...) so what should I get? I have alimited budget and don't want something too expensive...

Oh, and if I *DO* get a scanner...can I use a CB 3' fiberglass whip antenna with it?

Thanks plenty!

Cross-posted to: rec.radio.scanner,alt.radio.scanner

The NYPD's radio system is only half duplex. The dispatcher can talk and receive at the same time, the portables can not. I believe the type of system is called 2 channel simplex. There is a 3 MHZ difference between the transmit & receive frequencies. The reason the dispatcher can talk in full duplex and the portables can not is because the dispatcher has a seperate transmitter and receiver, a handy-talkie can only do one or the other.

The FDNY radio system is set up in a similar way. The only exception is that we control the receivers output into the transmitter manually. This allows for one way pseudo-private conversation when the "mixer" is off.

Frank Raffa
Dispatcher FDNY

Hi. I'm looking to buy a scanner.
I am interested in any scanner you have for sale. I prefer handheld, with at lesat 50 channels. If you have a base or mobile, with less channels, I'm still interested, but I prefer the above type of scanner. The only restriction is that it must have the full 800-900 Mhz band either available or modifiable. Also, price should be $150 or less, and I prefer to pick it up, or you ship.
Thanks!
-ken

>Mobile scanners are not legal in D.C., Florida, Indiana, Kentucky,
>Michigan, Minnesota and New York.

The Florida law is interesting, and has loopholes big enough to drive a semi through!

The wording of the Florida law states that it is illegal to have a scanner "permanently mounted" in a motor vehicle. That means that handhelds on the seat ARE legal! Also, there's wording that specifies illegality if the radio is tuned to licensed police frequencies...meaning that it would be legal if the police calls were received on an image, or tuned slightly off the "assigned frequency."

All classes of amateur radio operators are exempt from the law.

>doesn't do what it is not meant to (It's a HAM transsciever, not a
>scanner!).

I am too. I use an HTX-202 and the lack of intermod more than makes up for the lack of expanded band coverage. But I do have a problem with Radio Shack playing "cop" here and making a judgement as to what I should do with equipment that I purchase from them. They have a long history of this...before the ham radios, it was scanners. Radio Shack was one of the first manufacturers to block the cell bands out of their 800Mhz scanners...and at the time, there were no laws requiring them to do so.

> This is the first time I ever heard someone refer to light as radio
> waves!

Don't get out much? You've never seen a spectrum chart that shows
light (IR, visable, UV) up a the top? Never heard the expression,
"this thing covers every band from DC to light"? Any novice radio
hobbiest can tell you that light is electromagnetic energy.

> Here's my analogy -- radios waves trespassing on MY property are fair
> game for me to demodulate. Likewise, photons trespassing on MY
> property are fair game to be collected and magnified -- i.e,
> binoculars are o.k. Sounds waves, trespassing on MY property have the
> right to be listened to -- do you suggest I plug my ears if my
> neighbors are having an argument?

Only if they are keeping you awake. If you just hear it - that's it,
you just hear it.

Heres a hypothetical - From my bedroom window, I see you having an
argument with your wife. I can't hear you clearly, but from your
actions, I can assume you are really getting into it. So I take out
my "bionic ear" (one of those sensitive mics on a small dish),
aim at you and start listening in. I guess that would be "rational"
..ethical...morally OK? Am I peering into your business?

Your rationale is building a case that says, even when you have a
direct conversation with someone in your own home, you don't have a
reasonable expectation of privacy...unless you take action to keep
others from listening in by encrypting it...

..but then the peeping toms start posting things to this group like,
"Subject: How can I decode encrypted cordless phones?"

> Just as my truck would still be blue, those radiophone users have no real
> expectations of privacy.
> Law, yes. Bad law. Any law which attempts to change physics is a bad law.

I haven't seen anything in the ECPA that changes any physics. It
regulates the actions of people. Just like laws that say you can't
run red lights - physically you can - but the law says you can't. The
law requires you to take a different course of action... stop and wait
for the light to turn green.

Bad law? Could be. But not all of it.

Can I monitor the phones calls on the cable in my back yard?

I like the PRO-60, too. Think of it as a PRO-43++

> Does anybody know who makes
>this for Radio Shack ...

General Research Electronics (GRE) of Tokyo.

For more PRO-60 info, see my review in Sept 1995 Monitoring Times.

The PRO-60 I tested was probably defective because it drew 2 mA while
turned off, running my batteries down. It bore a low serial number and
the owners of later PRO-60s I spoke with report no battery problems
in their scanners.

I love my Pro-26. I'm just pissed off at SRB (a close friend) for talking
me into scanning in the first place. :)

Great performance. Depending on volume my battteries last 3-4 days. Wish
there was a computer interface for it to load frequency sets.

It's fallen off my desk twice and not a scratch.

One improvement they could make is in memory bank allocation. I'd rather
be able to program how many frequencies per bank.
My local police use 2 freqs. so I could program bank 1 to hold 2
frequencies. Theoretically, you could have more than ten banks until you
reach 200 stored frequencies. You get the idea? Just make turning on and
off banks a two digit system, i.e., 01,02,56, etc.

My American version is missing those obvious channels. So I ask, why is it
illegal to listen to those frequencies, but its totally legal for all
these radio frequencies to pass through my body 24 hours a day? Where's
the justice in that?

It's the best scanner by Radio Shack. Even better than the base unit
Pro-2042 which blocks 521-759 MHz.

Take it easy,

Andy

I bought an AOR8000 a few weeks back. I paid $630, which included a leather case with clear plastic windows, Scout modification, no-gaps, and two-day shipping. All in all, that would be a pretty good deal compared to a lot of mail order places in the US, which sell only the "gapped' model.What soured my deal, however, was the $42 customs duty. While I figured that paying it was near certain, I was a bit taken aback by the amount. Bottom line is that I paid a few buck more that I might have stateside but I got a no-gap model without the bother of having to reprogram it. (Actually, I quickly wound up buying an interface and software since the AOR8000 absolutely demands it, in my opinion.)

Source record: 248170

> ==========Jeff Long, 10/2/95==========
>
> I'm headed to a Winston Cup race and was wondering if anyone has
> this year's
> frequency list. Thanks.
>

The following is from http://www2.msstate.edu/~rls3/wcscan,
courtesy of Mark Breland and Roger Smith. I was at the N.
Wilkesboro race on 10/1, and verified most of this to be
accurate, except that Dale Earnhardt was using the second listed
frequency, and NASCAR seemed to have switched over to their new
frequencies completely. I also found Ernie Irvan's frequencies
in an updated list:

88 Ernie Irvan 466.5750 465.9000

--
Nelson Yount

==========

Here's the latest in updated Winston Cup frequencies as verified by
Mark Breland at Richmond, VA:

As of September 9, 1995:

~~~~~~
NASCAR Winston Cup Scanner Frequencies:

The first channel listed for each driver is the last one that team
was verified to have communicated on. The #11 Brett Bodine channel
no longer seems to be scrambled. NASCAR is in the process of
transitioning from one set of frequencies to another...since they
still use frequencies from both sets, they are both included here.
Be advised that some teams hop frequencies from race to race and
even day to day...keep trying their different frequencies until you
find them.

Frequencies used by the media vary from race to race, the listed
frequencies are those verified to have been the last ones on which
they were heard communicating. To find the production channel for
the covering media at any given event, it's recommended to use the
scanner's search mode between frequencies 450 and 470.

A friend of my brothers knew EVERYTHING about Radio Shack.. he worked there for about 2 years and had all the numbers to every product memorized. Of course he had played with virtually everything in the store, figured out how to delete merchandise from inventory and ended up with a grand theft felony charge... but.. he knew it all. The ultimate radio shack employee.

Hello! I would like to request that someone provide me with the frequencies used by the Air Force's Blue Angels. They will be performing this weekend here in San Francisco for Fleet Week. Please keep in mind that my Realistic Pro-34 cannot handle any frequencies higher than 950 MHz.

If this letter is a repeat,please forgive me. When I pressed the send button,I got disconnected from AOL. I don't know for sure if the previous letter was sent.

Thanks in advance!!

OK Dan,
You're the man! I need your help. I live in Murfreesboro, Tn. About 30 miles near Nashville. They just added another cell tower to our town. I want to monitor just my town or maybe even a 5 mile radius of my home. Have no interest in hearing Nashville which I would now if I were to monitor, I'm not of course:) Would these frequencies stay the same for this small area, (until they change it, 0f course. If I were to program just these frequencies in, would it not limit the listening range. With a limit search I would get it all. Second, how do I obtain these frequencies for a particular cell. If I got in the car and drove around a particular area with my phone on and someone monitoring at home, would that give me some of the frequencies and then I could figure out the group of frequencies that the cell covers? Who would have the info. Cellular one has no reason to give me the info if I were to ask, right. One particular area will always be covered by same cell, right, but different frequencies?

Are you sure? It may be that I just have my technical facts a little
screwed up here, but some local hams told me that when they (illegally)
use their modified HT's on a GMRS frequency, they have to hold the
microphone away from their mouths more because they overmodulate the
frequency (when received on a standard GMRS radio).

Is there something I'm missing here?

Subject: Uniden BearCat 890XLT Features?

>>Could anyone please tell me the specs on the 890XLT?

Fm: Jeff Goldman [CEFORUM] 76437,1146
To: All

(From a 1993 review of the BC-890XLT)

It is as if the Bearcat engineers checked out all of the top scanners and decided to incorporate their best features or to improve upon their various features. We end up with a thoroughly modern and definitely user-friendly scanner. Only constraint was the price point they were working within; hence, this receiver isn't continuous coverage, has only 200 channels, no user-programmable alphanumerics, and is double conversion. No big deal to me; I didn't want another FM radio anyway. <g>

Some of the outstanding features are its ability to do a Count of how many hits (or times the squelch is broken) from when you turn on the scanner. If you run a Scan, then when you check the Count it'll show how many hits for each and every channel you scanned. Or you monitor a channel in the Manual mode and leave the scanner in the Count screen. This constantly updates each time the squelch is broken. It does stop counting on a channel when it hits 99.

The Dim button is actually a triple-action button which turns On, dims, and turns Off the screen! There is a soft beep when you enter a freq. It VARIES according to volume, and isn't obnoxious when using an earphone. The CTCSS board (BC-002) that is used for the old BC760XLT is the same board as used in the BC890XLT. The feature is fantastic; there are no strange side effects (ie clipping of audio) when scanning.

While scanning, the screen scrolls the word SCAN. You do see the letters representing the banks that are enabled and the one that it's in at the moment is flashing. But, since the scanner uses Auto Sort, you don't see the scanner jumping around wildly while it scans freqs in order in each of the banks. So, I clocked the speed during a Search instead and came up with 16.6 cps in the Normal mode, and just over 100cps in Turbo Scan mode. Unlike many RS scanners, the word Turbo is displayed to let you know which setting you're in.

The unit has a transfer mode. This is where you can move a freq from one channel EITHER to the first free channel in a bank you select, OR you may move it to a previously programmed (not empty) channel of your choice. This deletes the original channel the freq sat in.

Looks-wise, this black scanner is a killer! Everyone in my electronics class was blown away, especially the teacher. I kept trying to tell him about the

various features (including Auto Store), but he just wanted to hear -shall we say- interesting sounding "images". <g> These images of the you-know-what band go UP in freq 21.6kHz (unlike the BC200XLT's 21.7MHz). On 800MHz, you may not change to 5kHz steps, but audio quality you-know-where is just fine. No lie. :-) I presume the restoration will be a simple desoldering of a surface-mount resistor, similar to the mod in the new 700A. This evening, I compared the sensitivity on 800MHz with my hot Pro 43 (with both scanners using 800MHz antennas). They were very similar!

Audio output and quality are excellent. The speaker is on TOP. The way the stock whip mates with the BNC connector in the back of the scanner, it never will fall over. The Wx Search DOES include the extra 2 Canadian stations, plus, of course, the normal 7 NOAA freqs. Wx Alert can only be used when the scanner is left ON and set to Wx Search. The receiver is muted, and when an alert tone sounds (yes, you can test this) it is a LOUD SIREN.

Priority is incredibly upgraded! You may choose ANY channel within a bank (up to 10) and activate any or all. You are not forced to endure the one in the first bank anymore if you don't want it enabled. Priority may be used in ALL modes, including Wx Search. Like the Pro43, it remembers that you were in the Priority mode when you turn the scanner Off and back On.

The AC adapter is hefty and is not built into the scanner. The latest version of the Bearcat car cig lighter adapter (an option) now has a coiled cord, which is really nice.

I've made sure that the BC890XLT still has the circuit whereby it locks onto the center freq of a strong channel during a Search. When the unit is monitoring a channel that has CTCSS enabled, the display alternately flashes between the freq on the channel and the subaudible tone you've set. Unfortunately, there's no easy way to figure out a CTCSS freq (either by doing a PL scan or by stepping manually through all the freqs fast). That's why a good scanner guide is a must.

Size of the scanner is similar to the RS Pro2006, and the flipdown feet are far nicer than the RS's. thes snap into place and have rubberized bottoms. There is an Aux function (and special RCA-type jack) to trigger a tape recorder on a user-specified channel when it is active. This is different than just having a built-in VOX control that keys-up on ALL transmissions!!

If you ever want to unLock all channels that are locked in a bank (aside from zero-ed ones), just hold down L/O for a couple of seconds until you hear a double beep. This is most convenient. Also, you may simultaneously hit SCAN 2 9 upon power-up to reset the scanner. The first 31 channels have various freqs, though all the rest are empty and locked-out.

My first impression is that this scanner is an absolute Work of Art. This is partially due to Uniden making the best of their many patented circuits, and also because they took time to improve so many things. This adds up to a first

(Continued from previous message)

class scanner in performance and ergonomics! Easy to use for beginners, and competition-quality for professional scanner buffs, it will be hard to beat.

Sb: BC890XLT REVIEW Pt 2
Fm: Jeff Goldman [CEFORUM] 76437,1146
To: All

Just to add a few more notes to last night's review, the squelch has almost no hysterisis, which is really great. The scanner uses a lithium battery, which means (according to the manual) that the unit will retain info if unplugged for 5 yrs.

And the 890XLT continues to have the Bearcat "query" feature, whereby when you enter a freq into a channel, it'll automatically tell you if that freq is also entered into another channel!

The VFO knob is a dual-function control, and may be used for Up/Down channel or Up/Down freq use. An LED shows which setting is enabled. The LED dims or goes out depending upon the Dim button setting on the scanner.

Fm: Jeff Goldman [CEFORUM] 76437,1146
To: All

Yep, another followup. Other scanners have had AutoStore before, but it was a stupid AutoStore. The AR1500 uses Bank 9 for that purpose, and you can't put anything in there manually evidently. If the same active freq keeps getting scanned, it'll keep getting written into the AR1500. And if you fill up Bank 9, it'll overwrite all those other valuable freqs. And it does all this at an incredible 18 cps.

On the other hand, I've discovered that the BC890XLT has an intelligent AutoStore system. It does its Search at just over 100cps and will store into ANY bank or BANKS that have some clear channels. It WON'T overwrite channels that aren't clear. When it's done loading up those channels, it beeps and says END. It WON'T rewrite an already AutoStored freq! I even tested this on the Wx band where there were only a few active freqs. After 10 minutes of repeatedly searching by the same active Wx freqs, only 2 freqs had been AutoStored... and only ONCE! Bravo to Uniden!!

One more thing. Yes, you certainly may get intermod (like all scanners) or images (like double conversion scanners) in the 450-470MHz range, especially when you have pager towers and Ham repeaters in the area. With the optional CTCSS board, say goodbye to ANY problems listening to POLICE, FIRE or EMS in

that range (naturally, as long as your local services are PL'ed)! It really, really works.

On Sunday Oct 1, I noticed that the Sparks Nevada Police departments channels, 856-57-58-59-60.212, were very very quite. After checking all my antenna connections I realized that the channels were empty I also noticed that the Sparks FD was back on their old VHF channel158.775. Any of you locals around Reno Sparks know where they moved to?

I miss the noise!

thanks JE

>Don't get out much?

Good start. After all, doesn't everyone in USENET begin with a
personal insult? No, I guess not -- just arrogant bastards.

>You've never seen a spectrum chart that shows
>light (IR, visable, UV) up a the top? Never heard the expression,
>"this thing covers every band from DC to light"? Any novice radio
>hobbiest can tell you that light is electromagnetic energy.
>

Yes I am aware that light is electromagnetic energy (call it EM). I
am also aware that radio is EM. But I wasn't aware that it followed,
then, that light was radio. All I can conclude is that both are EM.

>Heres a hypothetical - From my bedroom window, I see you having an
>argument with your wife. I can't hear you clearly, but from your
>actions, I can assume you are really getting into it. So I take out
>my "bionic ear" (one of those sensitive mics on a small dish),
>aim at you and start listening in. I guess that would be "rational"
>..ethical...morally OK? Am I peering into your business?

I will be consistent and repeat that as long as you're on your own
property you are NOT violating anybody's rights in these cases.

>Your rationale is building a case that says, even when you have a
>direct conversation with someone in your own home, you don't have a
>reasonable expectation of privacy...unless you take action to keep
>others from listening in by encrypting it...

Let's examine those words -- "a reasonable expectation of privacy."
How does that expectation coincide with the fact that binoculars,
telescopes, antenna mics and radio receivers exist? In other words,
why SHOULD there be a reasonable expectation of privacy UNLESS the
articles I just named were OUTLAWED??? Do you suppose that it is
possible to enforce a law against using an antenna mic on your
neighbors WITHOUT outlawing antenna mics? Can you tell me how?
Because if you can't, then you MUST conclude that no reasonable

expectation of privacy CURRENTLY exists. In that case, it's not MY argument that will cause it to be such.

>..but then the peeping toms start posting things to this group like,
>"Subject: How can I decode encrypted cordless phones?"

>----
>Curtis Wheeler - Pleasanton, CA

Well Curtis, as long as we have busy-bodies who keep the peeping toms in check we will avert the apocalyptic outcome that you posit.

I'm sure you know of the tower, ground, clearance delivery and
departure but I will include them anyways. Some advice before I get to
the freqs: if you take the rubber duck off your rs 51 you will probably
receive the closest transmission but either way here are some freqs.

Tower 120.95 S
133.90 N
Ground 121.65 N
121.75 S]
Clearance Delivery 121.4
Los Angeles Center-125.65,135.75,125.8,125.85,126.35,133.3
LA Flight Watch-135.90

I wish I had the time to send you the massive amount of freqs. But if you
email and tell me that you haven't gone on your flight I will send you
the rest.

Good Luck

Call Gall's Inc. They are a large supplier of public safety equiptment. They sell just the item your looking. I have their latest catalog and the holder retails for $14.99 plus S+H. Brief description you squeeze the sides of the holder and the sides move in to grasp the unit. It also has a quick release button and comes with mounting hardware to screw it to whatever you want to secure it to. I also saw the same item at my local Radio Shack. Although their product was a little more expensive because it included a snakelike connector that allows you to position the holder wherever you want (i.e. if you have a large passenger and wanted to move the holder out of the way or closer to you.). You can contact Gall's at 1-800-477-7766 and they'll send you a free catalog. The product number is J-VEO40 and it is called a Handheld Radio Universal Bracket. Hope this helps.

I just was given a copy of a mag called "2600 The Hacker Quarterly"
On page 26 of the Spring 95 issue (an article "Cellular Interception
Techniques") it says:

"Frequency counters are also a useful piece of equipment. After having
experimented with the Radio Shack unit, I have discovered that using the
supplied telescoping whip antenna, it will lock on a 3 watt phone running
with a 5/8 wave antenna from a range of 50 feet. I'm sure the range could
be increased by using a bandpass filter, amplifier, and/or cellular antenna."

it goes on then about other equip. etc. I too wondered how effective these
are - their cost is more appealing to me than the Scout, but . . .

Ps The "2600 Hacker Quarterly" is one of those mags that you can read
cover to cover. It's chocked full of articles from computers to ATMs to
phones. Unfortunately I just heard of it - it's been around for 11 years!

I was told the Barnes and Noble?? carry it - get a copy!

>Is there an antenna?

>>A good operating unit with the crystal, reed and batteries may run about
>>$150.00 plus charger.

>Reed?

The Motorola Minitor pagers come in a wide variety of configurations.
They are all based on a single channel VHF lo VHF hi or UHF reciever.
In fact for each band there are specific models for portions of the band.
on VHF low there are 5 different reciever boards depending on what
segmentof the band the reciever is for. for example one model will only cover
45-50 MHZ. The same is true for VHF HI (4 different models) and UHF
(5 models).
The antennas in these pagers are internal to the pager and consist of a tuned
circuit . The antenna tuning is fairly critical for good reception. This
one of the reasons for 5 different models to cover one band.

The second half of the Minitor pager is one of 4 "decoder" sections.The
simplest of which is the carrier squelch. This funtions exactly like a single
channel reciever. Any radio traffic on the channel is heard throughthe
speaker.

Then there is a model which only opens the squelch when the propper PL
tone is on the channel

Then there are two models that actually decode page tones.
The page tones are decoded by reeds or active filters, depending on the model.
The reeds or active filters are made for specific tones and plug into the
decoder board. The tones that you hear over your scanner before a call is
dispatched are what actuate these pagers.

all of these pagers except the carrier squelch models have a mode switch to
allow the user to listen to all radio traffic on the channel. (turn the pager
into a reciever).

Andrew

252. Re: WTB: Pro2035 / Opto 535 / Cool Windows Software

Newsgroup: rec.radio.scanner
Date: 1995-10-05 00:00:00 UTC
From: "Andrew Clegg", "B 2 Rm 271P", 767-3881 <clegg@funafuti.nrl.navy.mil>
Message-ID: <451244$cv7@ra.nrl.navy.mil>
Source record: 248102

Fred,

I bought a Pro-2035 a few weeks ago. It's a nice radio. It's hooked to a discone on my roof. It does much better handling overload problems than my BC 200XLT did, plus it has an attenuation switch (10 dB) on the back. It still gets overloaded by FM BCST on the Air band, but not too badly. The audio quality is good, and the front-panel ergonomics are OK. One drawback (in my opinion) is the grouping of 100 channels into each scan bank. I would prefer more scan banks, each with fewer channels. This will not be a problem if you are going to computer-control the radio. I don't have the Opto 535, but I've heard it's good. It does not come with software, however, except for a demo.

This weekend I picked up a used AR-2500, which is a 0.5 - 1500 MHz coverage radio with built-in RS232 port. The built-in port is a nice feature, and the 2016 frequencies you choose can be downloaded by computer. Because of hardware limitations, the AR-2500 can only scan at a very slow 2 channels per second under computer-control, so this is not the way to go if you want fast scanning (I believe the 535 / 2035 combo can scan at about 80 channels/sec). In my very informal tests, I found the 2035 to be a better receiver, but the 2500 covers more frequencies and adds SSB capability. I found the reception suprisingly good on HF (all things considered). It actually can be used for good SW BCST band reception. It also has a signal strength meter, which I believe the Opto 535 will add (through software) to the 2035.

Sorry to ramble on. I think the 2035 is a good radio. One last thing, the 2035 has been discontinued and replaced with a more expensive model which is essentially the same except for a better search-and-store utility and a different colored backlight (yellow instead of green). If the 2035 didn't out-perform the AR-2500 in some categories, I would offer to sell you mine--my wife gave me that look when I came home last weekend with YET ANOTHER "noise-maker" (her general-purpose term for any radio-related item).

Good luck!

Andrew Clegg

Loarie -

The Blue Angels have canelled their performance in SF this weekend for Fleet Week. They are having some internal flight safety problems that have required them to go into a Safety Standown. It is most likely that all of their performances for the rest of the year will also be canelled. Sorry.

However, you CAN come over to NAS Alameda and take a tour of the historic WWII aircraft carrier, USS Hornet (CVS-12). We will be having her open for public visits Friday through Monday, 10 AM to 4 PM. If you do come over, look me up - I'll be standing OOD on the quarterdeck where you come onboard.

In answer to your question, there will be about 20+ frequencies that will be used. It is dependant upon the route taken by the aircraft and what center boundaries it crosses. There is no one general frequency that you can use. My best advise would be to look up JFK tower frequency and listen to that.

Also, you could look up JFK Clearance delivery frequency and listen to the clearance given to your airplane. Towards the end of the clearance, they will tell the pilots what frequency will be assignet upon departure. If you follow that freq, you will be able to hear the pilots accept the frequency change to the next sector and will be able to follow the communications like that.

(This is assuming that the Flight Attendants let you use the radio, of course)

256. Texas State Fair Frequencies

Hello all,
I am looking for some suggestions on getting a new scanner. I have a 200 channel hand held regency that just took a dump on me (My dad is going to try and fix it, but we are both at a loss as to what's wrong with it) and I am curious what is out there. I work as a newspaper photographer and I need at least 100 channels and 800mhz capapbility. Basically something from Rat Shack would suffice. Funny thing is, now that this $300 digital handheld is shot, I'm using a 4 channel Rat Shack crystal scanner that I got in 1983. Thanks in advance.

A local fellow has a Pro 2006 scanner for sale. He says it 2.5 yrs
old. Does this scanner have the ability to scan celluar. If not is
there mods that can be done to make it celluar capable.
Also what freq. does celluar use. Thanks.

According to Radio Shack salesman, RS sells an 800mhz "translator" that receives 800 but sends it to the 400 mhz range so it's "legal" to receive cell. Is this true? If so, does it work well?

I cannot speak for the RS unit (I didn't know they made one), but I have used one made by GRE that I bought from Grove Enterprises for many years.

It works very well on my old Bearcat 210XL and allows me to receive 800 Mhz transmissions on this old scanner.

The sale of such converters is limited by federal law to stock on hand, but it is legal for consumers to continue to use such converters.

Uniden Sportcat 100 Channel Portable/Digital DOES pick up the 800mhz with
no problems whatsoever!

265. Background noise on BC9000,3000

Newsgroup: rec.radio.scanner
Date: 1995-10-05 00:00:00 UTC
From: mkilar@newshost.li.net
Message-ID: <451j3p$95a@linet02.li.net>
Source record: 248115

Hi -

Just got my new BC9000 and 3000 units from Grove. Their performance is better than I expected in every respect. However, I have noticed a minor audible background sound when scanning, especially in the 400mhz police bands, and to a lesser extent, in the other FM bands.

There is a definite background "tone" of between 200 and 300hz which can be heard clearly when the listening to regular transmissions. It is more noticeable using an external speaker or good headphones. I vaguely remember a similar sound when operating ship-to-shore VHF radios. The tone is continuous, and seems particularly pronounced on the police radio signals. It in no way obscures the conversation, but it is slightly annoying. A RS PRO 2006 and older BC200xlt scanning the same frequencies do not have this background sound, and placement of either the BC9000 or BC3000 handheld seems not to make a difference.

This is clearly an audio frequency (as opposed to a digital sound or artifact),
and is somewhat reminiscient of SSB audio, although far less pronounced. It is not 60hz hum (I know that sound), plus I was able to pick up the tone on pauses in conversation with an audio frequency counter. Is is also sine wave in character, not the buzz of square, sawtooth or digital interference.

Since it is happening on both radios, I assume it is not a defect. Perhaps it is a result of the more sensitive circuits on these new radios, or a phenomenon common to better equipment.

Does anyone have any ideas? The folks at Bearcat didn't have a clue.

Thanks,

Mark Kilarjian

Message-ID: <451phk$16e@newsbf02.news.aol.com>
Source record: 248121

For what it is worth, Hillary Clinton was recently in New York's Hudson Valley--starting in Kingston, NY at a fundraiser for Congressman Maurice Hinchey, moving to Hyde Park, NY to receive a medal at Eleanor Roosevelt's former home, and then on to Poughkeepsie, NY to address the students at Vassar College. Zippo on the Secret Service frequencies from the second edition of Monitor America--not even the static and beeps that I heard when Bill Clinton visited Hyde Park in February 1993. Best monitoring was on local police frequencies and National Park Service (keepers of Eleanor Roosevelt's home) and Vassar College frequencies.

President Clinton and Boris Yeltsin will be meeting at FDR's home in Hyde Park, NY on October 23--I'll be listening to the same frequencies again (plus more media ones) and will be happy to post any successes apart from the obvious local frequencies. Any hints from folks who have successfully monitored Presidential activity on Federal frequencies other than what is listed in Monitor America would be appreciated.

>to the 9913.

You might want to consider getting a right angle BNC connector to use at the radio end of the coax run. This would take a bit of the strain off the connector as it is mounted in the radio letting the weight of the coax hang vertically rather than having it try and force the radio to align itself with the inflexible coax (am I making any sense?).

Source record: 247986

I borrowed another idea from one of the ham magazines and it worked well for me.

Take a coat hanger or other stiff metal (aluminum "ground" wire, welding rod, etc) and bend it so that the belt clip of your HT will slide over it, then shape it over the dashboard so that it hooks into the defroster vents. Then you can hang the radio right on the front of the dash with the antenna oriented vertically.

The *better* Type Accepted radios (GE), use phase modulation. :-)

Actually, when the FM rig uses the proper pre-emphasis, the resulting
signals are indistinguishable from a PM signal. It just takes extra
circuitry for a FM rig to output the proper signals.

According to the owners manual these are the classic symptoms of a
scanner that needs a reset. To reset a Pro-43 you must hold down
both the CLEAR and 0 keys while turning on the power. This procedure
will aslo erase all existing programming.

You would be bettter off building or buying a "trap dipole" antenna. It has coils or traps that make the antenna multiband. There
would be a great deal of interaction between the elements on an antenna array as you drew. Besides, you'd probably kill a few
flying birds with the desigh! <g>

> Also how to you go about measuring an antenna to find which freq
> it is tuned for ?? I don't mean measuring the length, but actually
> measuring the signal strength and freq online ? (oscilliscope ??)
>
The best way to measure resonant frequency without the use of a transmitter and an swr meter is with a noise bridge. Experience
says that the length of antenna elements for reception are not so critical that if you follow the formulas in the ARRL antenna
book, you will able to receive the intended frequencies. Resonance is far more critical when you are radiating EM energy that
when receiving it, especially since most contemporary receivers are fairly sensitive to weak signals.

> Looks like I need the ARRL antenna book ! and a few lessons on antenna designs
> and principles.
>
Try: http://www.arrl.org/ for the ARRL. They have a catalogue of all their products as well as ordering information. The
antenna box is excellent, and now comes with an IBM compatable disk with various antenna design programs.

> Good start. After all, doesn't everyone in USENET begin with a
> personal insult? No, I guess not -- just arrogant bastards.

Mr. Wheeler began this heated discussion by his initial inflammatory posting. In it, he referred to those who monitor cordless phones, as well as those who simply believe in the right to do so, as "voyeurs" and "peeping toms." He continues to use these inflammatory terms:

> >..but then the peeping toms start posting things to this group
> >like, "Subject: How can I decode encrypted cordless phones?"

"Voyeur" is defined as "a person who derives sexual gratification from observing the naked bodies or sexual acts of others, especially from a secret vantage point." "Peeping tom' is given as a synonym for "voyeur." (1)

So Mr. Wheeler called those of us who believe in the right of citizens to monitor the public airwaves sexual perverts.

That's pretty personal, and extremely insulting. If someone called me that to my face, I would understandably be quite angry. I might even punch him in the nose. The flames he has received are the net equivalent of punches in the nose, and he deserves them.

Now that Mr. Wheeler has impugned the sexual habits of others, it's time for him to come clean about his own. How about it, Mr. Wheeler? Are you a pederast? Do you get into whips and chains? Or maybe you like girls to walk on you in high heels.

The bottom line: don't call decent people perverts and expect them to smile. :(

Ken

My sig is too large for you to see

I saw (2) pro43 (5A4) and (2) pro39 scanners, $200 - $175 respectively,
at a pawn shop here in Columbus, OH.

I'd like the 43 but it ain't 800mhz modifiable.

Beside the above modifiable feature, what are the pros and cons I
should know in order to get the "best" deal.

ie: scanning range, speed, modifications, channels <-before/after mods,
memories etc.

Would someone post (or email) a side by side comparison?

thanks ->bh

Has anybody come up with a mod for the PRO-2035 to make the backlight selectable? Also, if there are any other mods for this unit, I'd be interested in knowing about them. (I know it can't be made cellular-capable.)

And, too, are there any computer-interfaces for this unit? (I know... I am asking alot but I don't know how else to find these answers.)

Thank you.

I'm looking for a scanner that has one of those serial interfaces that picks up 800 mhz (so I can listen to the local police). The number of channels isn't real important, although at least 50 channels would be nice and I'd prefer a base scanner. I'm willing to trade an external double speed Sony CD ROM drive w/it's own controller card, cable and driver software for it. I got it back in April and paid $279 for it.

Hello out there...I've been away from this newsgroup for a while but have recently returned -- posts are as interesting as ever. I see RS's reputation hasn't changed. :-)

My question is this: because of my FD involvement, I need to monitor freq's around 33 Mhz. I am now putting in a second scanner in the car, but don't have an antenna for it. I have a glass mount, but it was terrible the last time I used it. Would using my already mounted CB antenna be a good idea? If not, any ideas?

Thanks in advance.

Gordon

>Steve

You may want to try the NJSP Trunked system Sunday morning. They have been
doing all escorts in Jersey (Newark Airport, Newark, Giants Stadium,
pick-up and hand-off at Lincoln Tunnel).

Try the following:
856.4625
867.4625
859.4725
860.4625

Not sure if you can get NYC. I'm sixteen miles out of Manhatten and get
Citywide 3 (Operation Shepherd) very clear.
470.8625 - CITYWIDE 3

Also don't forget the SS. They were pretty busy Wednesday with both the
Pope and Clinton here.

Good luck....

Robbie ;D

In New York the amateurs license only alows you to "equip a motor vehicle with a radio receiving set" you are still limited to "frequencies exclusively allocated by the FCC to duly licensed radio amateurs". I know it would be hard to prove what frequencie you were listening to. Do other states do this?

Sorry, your out of luck. The serial protocol for the MR8100 only allows remote
programming of the 100 channels, nothing else.

If you need better software for remote programming, check out Scan*Star
professional. I believe that Scan*Star is one of the few, if not the only
retail product that supports the MR8100.

313. FS: Pro 2005 and Yupiteru MVT-7100 and MVT 8000

Newsgroup: rec.radio.scanner
Date: 1995-10-06 00:00:00 UTC
From: lmilrad@passport.ca
Message-ID: <453er4$f8t@diplomatic.passport.ca>
Source record: 248018

I have a pristine 400 channel cellular modified Realistic Pro 2005 which I am considering selling (I've too many scanners already and being in Canada, each is cellular capable, as it's not yet outlawed here).

Problem is that I do not know what its value is but am open to accepting a reasonable offer given its "out-of-the box" condition.

I also have 2 YUPITERU scanners which I would like to sell - the MVT 8000 and the MVT-7100.

The MVT 8000 description is as follows:

It is a brilliantly designed front panel angled 200 channel ac/dc unit. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on a desk.

It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other normal goodies.

Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:

Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)

Of course, you can change factory settings. It also has a battery save function.

$650.00
plus shipping
The MVT-7100:

Previous posting on the MVT-7100 was as follows and it has everything found on the MVT 8000 and much more including USB and LSB:

MULTIBAND HANDHELD SCANNER 5Khz-1650 Mhz continuous coverage With SSB - 1000 Channel-AC/DC - less than 6 mos. old and hardly used. Includes protective leatherette case.
$625.00 plus shipping

Message-ID: <1995Oct6.113653.625@flying-disk.com>
Source record: 248019

I am trying to use my PRO-2006 to decode a data signal. Unfortunately, the audio section takes the nice data and "processes it to death". This is fine for voice signals, but hell for data.

I am looking for a modification that will let me tap off the "audio" signal as soon after the discriminator as possible, buffer it, and feed it to an output jack.

I could not find anything like this in any of Bill Cheek's books, but am hoping that one of you might have done something along these lines. Any advice and/or pointers would be appreciated.

Newark was buzzing with activity Wed. and so were my scanners. I Quickly learned that Newark PD was using their regular ch. 2, 460.175 as the main "event" freq. Newark Airport Security Command Post was on 453.650. These two freqs. were super active all day and provided some great listening!
I heard some ordinary traffic and radio checks from the regular Secret Service chanels, Charlie, Baker, Oscar etc.,but prior to VIP arrival they went almost totally coded. I caught the arrival of Air Force One on 407.850 and heard the airport tower at their regular 118.3. The NJ State Police were all over with their trunked system but I heard some interesting stuff from them. For instance they and the SS were headed over to a Downtown Newark motel to grab a guy who apparently made some threats.
NYC closed off some freqs. for exclusive use during Operation Shepard. It was fun listening to them institute their infamous "frozen zone" around the Popes motercade and residence. 470.8625, 470.6625, and 476.7375 were among those that were active. It's been a wild ride so far!

From: post1@ID1.AL.ALCOA.COM
Message-ID: <post1-061095170212@jcp-pcmt.atc.alcoa.com>
Source record: 248022

I recently saw an advertisement in one of those "Creative Solutions" catalogs (I don't remember the name) for what was effectively a scanner but not referred to that way. They claim that this device can alert you of a police car within 3 miles by detecting their communications equipement. Could this truely be? If so it would be a nice think to know and I would like to know how they do it. Are they possible picking up a repeater? If so how would I setup my Yupiteru 7100 to do the same thing. Any ideas?

Thanks for any responses,

Here in the US, it is. AFAIK, it's OK in Canada, too.
The frequencies are something that exist, like leaves. It would be (and is)
laughable that a government (like England, for example) will give the
publishers of frequencies so much trouble.
But, that's life.

Ken - Just read this from the SJ Mercury News:

"Fans of spectacular but noisy jets can rest easy:The Blue Angels, the Navy's precision flying team, announced in Alameda on Thursday that they will go ahead with plans to fly in this weekend's Navy Fleet Week celebration in San Francisco. The Blue Angels, recruited from the best Navy and Marine pilots, canceled shows in Virginia and Louisiana the last two weekends, reportedly because of "procedural errors" that have led to concerns about safety. And rumors swirled that the Blue Angel's might pull out of Fleet Week. Lt. Cmdr. Doug Thompson, a left wingman, said all systems are go for this weekend's shows, scheduled to begin at 12:15 p.m. Saturday and Sunday."

So it looks like they are going to fly after all. C-ya, Lee.

I was thinking of purchasing a several items by mail-order from a communications store in Connecticut that advertises in Monitoring Times. When I asked about the return policy I was curtly told, "Sorry sir, I don't sell items for evaluation, Connecticut State Law forbids me to do so."

I was quite taken aback and when I told them that several other stores do have a reasonable return policy (e.g. Grove - complete refund and EEB - 20% restock fee), the person finally conceded that "some items" could be returned with a 20% restock fee, but they would "have to think about it".

Needless to say I will NOT invest my $$ in that outfit - but I thought others would be interested in this "new approach" to sales i.e. invoking state "laws" to prevent you from getting your money back on items that do not suit your needs.

>Thanks
>Mike

I use 9913 for UHF and VHF ham satellite antennas, and have done basically what you tried with good results. There are (at least) two things that will affect your losses in adding a short length of RG58...

1. The quality and length of the RG58. Use something like a good Belden RG58 style, rather than Radio Shack's, and keep the length as short as possible.

2. The way the two lengths of cable are connected together: I have N connectors on both ends of the 9913, and a 2 foot piece of RG58 with an N on one both ends. These are connected together using an N barrel connector. If you are concerned about loss, don't just solder splice the two types of cable together, use low loss connectors (like N) and a barrel. There was no noticable loss when I added the RG58 to the system. The biggest problem I've had in the past is when a piece of the coax braid ends up in the wrong place inside the connector and shorts the center to the shield. In this situation, the antenna system will usually still work on receive at UHF and VHF, but will appear lossy.

Hope this helps.

>for the light to turn green.

Regulates people? How? Judging from the fact that 50% of the posts
in here deal with listening to cordless/cellular what regulating are
you talking about? The ONLY thing it does is give people who talk on
RADIOS the ridiculous expectation of privacy.

THAT is fraudulent -- and how did all this come about? The Cellular
industry, without the foresight to ENCRYPT the voice, greased the
palms of our beloved public servants. And now people give their
credit card numbers over the RADIO because congress tells them that
nobody's allowed to listen!

About your red light analogy -- the law doesn't say that you can
safely go when you get green. And I don't know about you but I don't
automatically go when I get green. I WAIT until all the other cars
going across my lane stop, because I KNOW that while it's illegal to
go through the red light, some cars may still go through. People on
radio phones, on the other hand, are told my industry/govt that they
have an expectation of privacy, but this is a LIE! To use your
analogy, people using a radio phone are more apt to conclude that it
is safe to proceed on green without making sure it is safe.

>Bad law? Could be. But not all of it.

>Can I monitor the phones calls on the cable in my back yard?

By law it is illegal, but how about logically? Well, unless I have
some agreement signed in writing (with the owner of the phone line)
that I won't tamper with a phone line, I have a right to do with it
what I please, if it is on MY PROPERTY. In other words, we don't need
a law for this either. Phone companies not signing such contracts
would lose customers fast (customers would know that their
conversations could be overheard with such service providers).
"Consumer Reports" would rate which phone companies did the most to
guarantee privacy, etc.

There are too many laws in this country. There are other ways,
besides getting the govt involved, of solving these supposed dilemmas.

>repair shop?
>
>
>
In order for you to enter a scan range, the scanner must first be in manual mode. You can put it in manual mode by pressing the "MANUAL" button, which will stop the scanner from scanning. Once it has stopped scanning, just press the lower freq and press "LIMIT" and press the upper freq and press "LIMIT" and press "SEARCH". I think this will solve your problem.

The reason it didn't work the other way, was because the way the 200xlt works, is that pressing a number while scanning will cause that bank to turn off and on (ie: pressing "9" while scanning will either turn that bank on or off - it's a toggle switch)

Good Luck

Len Gibbs

JC> the same thing. Any ideas?

Probably a BearTracker.
These scanners have the 'extender' frequencies tagged as priorities, and scan them. When a LEO in certain areas leaves his vehicle, he carries a handheld radio that uses an 'extender' frequency to operate the vehicle's radio. IOW, it's a repeater system from the officer to the car.
These only work when the officer is out of the car, and is using the radio. Of the officer is sitting there waiting for you to speed by, this unit will do you no good. It has a very limited ability to actually alert you to the presence of a LEO.
If you are on the open road, a CB is a far better bet; the truckers will keep you up-to-date on the locations of any smokies. Nothing against scanners, at all (I have far too many of them for that to be true), but the CB dioes that particular job much better.

First I want to say I am sorry that this has nothing
to do with the topic of this group. You may see this
message in other newsgroups, the reason is I am subscribed
to those too so please don't flame me. I have been posting
and reading to this group for a while. I just wanted to
let you people out know there is a way to get Cable TV for
FREE. I recieve this letter in the mail from a friend
that had told me it works. I gave this to one of my friends
and he had free cable in his house within 20 mins. I have not
tried this method yet but may soon try if my cable goes up in
price. If anyone would like a copy send the following to the
address below.

Address Envelope to:

FreeStuff
9393 N. 90th St.
Suite 102-289
Scottsdale, AZ 85258

Enclose in the envelope:

Send...

$1.00 U.S MONEY *** NO COINS *** NO CHECKS ***
inside a sheet of carbon paper or construction paper,
and send a *self-addressed*,*stamped* envelope to the
address above.

Thanxs,
Just think if you pay 30$ + a month. 1$ will save
you 359 + dollars a year.

One of the bigest differences between HAM and GMRS (Type acceptance)
is that the operator cannot enter a frequency. That is they may have
many pre-programed freq's, but they may not enter them.

Source record: 248036

: I am too. I use an HTX-202 and the lack of intermod more than makes up
: for the lack of expanded band coverage. But I do have a problem with
: Radio Shack playing "cop" here and making a judgement as to what I should
: do with equipment that I purchase from them. They have a long history of
: this...before the ham radios, it was scanners. Radio Shack was one of
: the first manufacturers to block the cell bands out of their 800Mhz
: scanners...and at the time, there were no laws requiring them to do so.

: -Drew in Charlotte-
: KF4DDM

Radio shack does not cater to the hardend ham or scanner fanatic. What
their market is people who are either casually into electronics or people
who hame no clue at all.

I have the 212 and I find myself all the time looking for my scanner to
listen to something when I have the ham.

What I think RS is aming for is not to make their products/service for
the electronics wizard but to make them simple enough for the person off
the street to use, enjouy, and come back and buy more. I know that all
the scanners except the newer 51 (Which I have) can be tweaked to include
the bands but, that is not what RS is selling to.

Also, they want to keep their greasy slick image untarnished by lawsuits.

>There are devices which look like they may be tuned circuits to recognize tones
>, but I'm not really all that familiar with the pager's guts (They seem like
>they were probably designed with 30 year old technology).
>Thanks for any help[you can provide.
>-ken

The three digits typed on the piece of paper will tell you the signal
to alert the pager. Usually Motorola designated a set of PL tones
with "dXXX" ie "d968". Sometimes there will be two sets for both
group and individual paging. "d100/140".

We just replaced a ton of VHF Minitors with Director IIs. You missed
a nice sale of Mintors set to 152.00725 with d968 paging reeds. Sold
20 of 'em at $10/each to an Emergency Management agency in a nearby
county. For some reason the Motorola shop would take them for
trade-ins.......

The Minitors are dinosaurs, but reliable dinosaurs....
Although I kind of like the Stored Voice and Vibra-page on the
Director IIs.

>don't have an antenna for it. I have a glass mount, but it was terrible the
>last time I used it. Would using my already mounted CB antenna be a good idea?
>If not, any ideas?

IMHO, the CB antenna should be adequate for monitoring, provided you
will just be monitoring around 33MHz. Just don't expect it to work to
hot for VHF/UHF/800.

And for goodness sakes...don't x-mit with it! :^)

I use a 1/4 wave 2m antenna for my scanner, and we use mostly UHF, but
it does the job.

347. J pole antenna using COAX instead of twinlead for its stub

Newsgroup: rec.radio.scanner
Date: 1995-10-07 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseDG29Bq.MuF@netcom.com>
Source record: 248045

A J POLE ANTENNA USING COAX FOR THE STUB

Instead of 300 ohm twinlead.

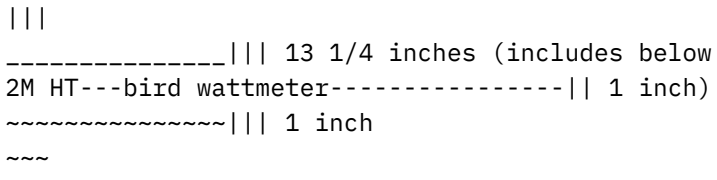
Decided to try using a piece of RG58 coax in place of the usual
300 ohm TV twinlead. They're both transmission lines. So, a
quarter wave length of eighter should work (factor in velocity
factor in measuring out a quarter wave length, twinlead is 0.88
and RG58 poly is 0.66). And the coax is unbalanced, so no
theoritical need for a choke balun (ferrite beads or many turn
coil). The coax shield is at RF ground potential, the RF is
on the center conductor, and the open end of the quarter wave
stub center conductor connects to the end of the half wave
dipole. The tap is formed by "T" connecting the stub coax
to the coax feedline from the radio.

Take some RG58, short shield to center conductor.
Measure 13 1/4 inches from the short, remove the outside jacket
and shield at this point and beyond. Leave an inch or 2 of
center conductor sticking out.

Measure 1 inch from the short, and prepare to do a "T" connection
here. Create a hole in the outer shield about 1/3 inch long
and peel it about half way round the coax. Then take a razor blade
and remove enough insulation from the center conductor to bare a
small spot. Enough to do a tack solder connection, which connects
to the center conductor of the feedline coax. And shield to
shield. Take care to get a good connection without shorts.
Take your time here. One probably could just use a BNC T connector
here, and make a short shorted cable for one side, and a longer
cable to feed the dipole on the other. Just keep the overall
lengths right.

Now connect a length of wire to the center conductor sticking out
the open end of the stub, enough so the length of the wire and
the amount of center conductor protruding beyond the end of the
coax shield totals 37 1/2 inches. This is the dipole part.

ASCII attempted diagram: |
|
|
|
| 37 1/2 inches
|
|
|



Used a 2 meter HT and a Bird wattmeter to measure forward and reflected power, indirectly SWR. My forward power was ten times reflected power, not bad. At one point, I had a bad T connection (bad solder joint) that caused the forward power to almost equal reflected power. Fixed that, and now it works like the twinlead Jpoles. Ran my hand along the feedline coax, and the stub, no effect on reflected power. Did get reflected power if I get near the dipole part, as expected.

And I could hit repeaters pretty well, considering I was in the basement.

Yeah, but it still amazes me that they would voluntarily cut out the cell bands since that's what most of the "persons off the street" want to listen to! These folks are basically clueless and don't know a keyboard from a motherboard. They'll see a 20/20 or Current Affair report on TV about how those evil scanner listeners are eavesdropping on their neighbor's phone calls...and the next day, they go to their local RS to get one! The conversation goes something like this:

RS SalesDroid: Can I help you find something?
Customer: Uh, yeah...I want a scanner
Droid: Great! What do you want to listen to?
Customer: Phone calls! I saw this thing on TV the other night, and...

So WHY would RS voluntarilly screw themselves out of a lucrative customer base like this? (Before the 1994 cellular ban, of course)

[Author was Ken]
[Posted on 7 Oct 1995 02:49:44 GMT]

For sale:
decoders for popular over-the-air digital modes.

I) POCSAG decoder... this decoder circuit comes with your choice of connectors.
It interfaces between your scanner and computer and allows you to intercept
pages sent in POCSAG (most popular) format at 512 and 1200 baud.
Displays cap code and page sent. Works for tone only/numeric/alpha pagers
on any band (VHF/UHF/900Mhz)

II) SWL decoder. This circuit decodes RTTY (amateur Radio TeleTYpe), morse code
, and SHIP/SYNOP weather station formats. Also includes an audio scope function
.

III) Combo unit- combines the above two circuits into one.

Prices:
I) $50
II) $50
III) $75
Included with the interfacing cables are shareware supporting software. It is
your responsibility to register/pay for the software to the respective software
writers if you are satisfied with them.
email arenek@rpi.edu

A friend of mine owns a dealer store and either this RS salesman knows something we don't or he is wrong, because we can find no evidence that RS has these converters. They used to be available from GRE, but I think most are sold out and they can't make more because of our friends in congress and that nasty ban they enacted a few years back. If you can find one though, they do work. They just move the 800 freq's down to 400 which is receivable by most scanners.

Also on one point the RS salesman is undoubtedly WRONG. This converter does NOT make it legal to monitor cellular. That is against federal and many state laws. In fact, Georgia passed a law this year making cellular monitoring a high misdemeanor w/ jail time. Yikes!!! I bet that stops lots of us ;]

hduff@humnet.humberc.on.ca
Writes:

;It's no technical challenge to be able to store out of band
;frequencies... R/S is trying to avoid getting caught up in
;the sale of Amateur equipment that can be perceived as illegal.
;Their HTX-100 10 meter rig and HTX-202 2M HT where "Ham Only"
;(The HTX-100 had USB/CW only...unworthy of CB use and the 202
;does not go out-of-band at all.) The HTX-212 reluctantly crosses
;this line...you can see that there are still limitations (no
;out-of-band store or TX).
;
;I'm a firm believer in using the "right tools for the job"...
;I have Amateur Radio equipment for use in the Ham bands
;and a scanner for LISTENING from DC to light.
;You shouldn't incriminate R/S for selling Amateur equipment that
;doesn't do what it is not meant to (It's a HAM transsciever, not a
;scanner!).
;It's nice for some to have the ability to use their Ham rig to listen
;outside of the band but I personally don't like to substitute front-end
;rejection for that privledge. I use my scanner for that and suffer
;little or no intermod on my 2m Ham rig.
;
;....and now, back to scanners...
;

Geez- I didn't mean for this to go on this long. I just wished that RS had been a little more forthcoming with this information. Again, shame on me for assuming that this radio would store out of band RX like nearly every other amatuer radio on the market.

As far as having the right tool to do the job, I fully agree, and do have a number of scanners which, as you said, are far superior to an amatuer radio transciever for this. The only point I was making was that the vehicle I mounted this in (a Camaro) doesn't have a lot of extra room, and I didn't want that "patrol car" look, so I was only planning on mounting one unit. As you say, this would limit my listening ability, but that really wasn't a concern, since our local public safety radio system consists of about 8 frequencies, all VHF.

I solved the problem by putting my ICOM which does do out of band RX in the Camaro, and installing the HTX-212 in my Bronco, which already has an AOR, so I didn't need this feature.

You could also consider what we do in two way. Put a more flexible
jumper between the radio and the stiff coax. A couple of feet of good
RG58 would probably do nicely.

364. Another PRO-2035 Question: "Auto Store"

Newsgroup: rec.radio.scanner
Date: 1995-10-07 00:00:00 UTC
From: boscoe@ix.netcom.com
Message-ID: <456e1u$28b@ixnews5.ix.netcom.com>
Source record: 248062
Cross-posted to: rec.radio.scanner,alt.radio.scanner

In the manual for the PRO-2035 (on page 2) it says:

"AUTO STORE - quickly finds and automatically stores active frequencies in channels, then searches for additional active frequencies *while skipping previously stored channels*.

If I understand this correctly, the PRO-2035 may find that 453.785 is active, automatically stores this frequency and then proceeds to scan for other active frequencies *excluding* 453.785, right? In otherwords, once it has "auto-stored" 453.785, it will not re-scan that frequency until it is taken out of the "auto-store" mode.

If that is supposed to be correct then my new PRO-2035 is on the fritz. It not only continues to re-scan the same frequency but stores it as a newly found active freq as many times as it finds it active. I had once freq. that was auto-stored over twenty times.

Is this the way that auto-store is supposed to work? (And I know, I know... Rat Shack and all that...) I'd like to know whether this is the proper way for the PRO-2035 to work or if I need to send it in for repairs while it's under warranty.

Thanks for the help.

I would recommend mounting a switch inside the case to disable the keylock button, so that it will be possible in the future to reprogram the scanner if necessary.

I would think that having to disassemble the case to reprogram the unit would be a sufficient deterrent to unauthorized reprogramming.

More than 20 freqs would be used. I can assure that because I have
been on the transcontinental flight from LAX-MIA which uses betwee 35-50
frequencies. As someone said earlier , it varies and the frequencies
aren't always the same.

>frequencies *while skipping previously stored channels*.
> [rest deleted]

It's a misprint. Just like the one in the catalog that claims the PRO-2035 uses triple
conversion. It does not. The manual makes no such claims and in fact shows the
following IF frequencies: 1st IF = 609.005 - 613.5 MHz and 2nd IF = 48.5 MHz.

The 1996 Radio Shack catalog shows the 2035's replacement the PRO-2042. It states that the auto-store function will not duplicate stored frequencies.

375. New AOR8000; some questions.

Newsgroup: rec.radio.scanner
Date: 1995-10-07 00:00:00 UTC
From: Michelle.Foien@internetMCI.COM
Message-ID: <456t8r$e0n@news.internetmci.com>
Source record: 248073

Just got an AR8000 and have two questions regarding the unit.

In the manual it says "Always use the mains charger provided or a regulated DC power supply of 13.8V @ 300mA or more using the provided DC connectin lead. NEVER CONNECT THE AR8000 DIRECTLY TO THE MAINS SUPPLY. " What does this mean? That I can't use the power supply provided and it's sole purpose is for charging the batteries? I thought I could just run it off this with no batteries. It is rated at 12vdc @ 300mA and in the manual the power requirements are 11-16vdc @ 300mA. Why won't it work.

Has anyone figured out how to unblock it? I saw some software that would, but I really have no need for new software. Is there a file floating around to unblock it?

Thanx.

Source record: 247942

I have one of the new Radio Shack Pro-60 scanners. It gets very good reception but I was wondering if there is any type of antenna that I could use to boost my reception. I live in a townhouse and do not have access to any type of outside antenna. I have tried a mobile antenna with the magnetic base without much luck. Also tried a mini TV antenna that Radio Shack featured in one of their mags...no luck either. Someone told me that I should not waste my time since the antenna that came with the unit has been "tuned" for the scanner.

Should I give up and stick with what I have? I have the luxury of living near LA so I get a wealth of frequencies. Maybe I should just leave well enough alone......

>lots of us ;]

I went into the local Shack store today (Manhattan Beach, CA) and
asked about the downconverters. The salesman said that they don't
carry completed models (that would violate the ECPA) but they do offer
a nice selection of kits. Believe it or not, (this is new) Rat Shack
is offering Ramsey kits. You place your order at the store and it's
mailed to you. The Downconverter kits don't violate the ECPA because
as a kit they are harmless. If you purchase one for the purpose of
assembling it to listen to cellular conversations then you are taking
your fate into your own hands. If you are an experimenter who just
wnats to "study the theory of down converting frequencies" then I'm
sure that that is well within the letter of the law.

Steve

If you need frequencies, I'll do a search for by state, user, or area (lat/long required for this)

I write the results onto a floppy in .DBF format that can be read by most popular database programs (Foxpro, Dbase..etc) Each search can yield more than 10,000 responses!

I do charge a small fee for the search, this covers the cost of the disk as well as some other associated costs.

send your search requests to:

JA MORAN P.O. BOX 25506, Tempe, Az 85285

contrary to what some say, it's not that difficult to monitor cellular, cordless, and other mobile phone conversations. On some radios you can get the harmonics while on others (like the three radios I have), you can monitor the frequencies directly.

Usually, Just when a conversation gets interesting, the call is handed off to another cell site!

If the phone companies, cellular carriers, and phone manufacturers really had privacy in mind when they designed and marketed these things, then they should have designed the phones to send the voice calls in digital format. Also, they should have designed some way to encrypt the Phones ESN (Electronic Serial Number). Some people monitor calls to get the ESN then `clone' phones so they can make `free' calls.

All this business about it being illegal to monitor cellular calls is a smoke screen. The cellular manufacturers, carriers, and vendors are trying to make up for their effort to save a few bucks by not designing the phones to transmit in ditital mode! Encryption technology is not new, it's been used by the military and diplomatic circles for several decades!!

You want cellular Frequencies, and cell layout plans! I'll send you a list if you send me a SASE JA MORAN P.O. Box 25506 Tempe, Az 85285!!!

I can also include a program that will tell you the channel number and mobile frequency if you enter the base frequency!!

Looking for suggestions on an antenna that performs well in the 30-160Mhz range. Also, where could I mail order the antenna? Not too concerned about the price.

YOu probably can take ascanner into Germany without any Problem, However if you leave Germany and have a scanner in your pocket on clipped to your belt, the airport security will get a bit excited. I brought a Scanner with me as well as my SONY-2010 shortwave. No problem in Frankfurt where I changed planes to go to Hamburg. On the flight from Stuttgart back to the US, I had to negotiate with airport security, airline represenatives, and also airport police..finally, I gave them the scanner, they put it in a pouch that was carried in the cockpit. When I came through customs, I had to find an airline represenative with a pouch with my name on it..my scanner was inside, the batteries had been removed...

Just purchased some 900 ma rechargeable batteries at a Ham show. The person selling the batteries also sold me a 100ma charge said that was the one to charge these batteries. He said it should take about 10 hours. My question is did I get taken on the charger? I am not out much $4.00 but wonder if I should be looking for another charger.

399. Re: Where find Scanfan in SoCAL?

I have seen it before at Ham Radio Outlet but its been a while. You probably would be better off ordering it from the publisher. They also market a plastic notebook sheet with major freqs. whicn is handy. You might also check with Bob Kelty who owns Mobile Radio Resources who has a number of freq. books that are the best in CA. These are also available on floppy disks.

Mobile Radio Resources
2661 Carol Drive
San Jose, CA
95125
408.292.4342 (might be old area code)

You might check with Scanners Unlimited in San Carlos, CA. This is the best scanner store in CA. and has a large selection of scanner books. Hopefully this is some help.

From: lager@primenet.com
Message-ID: <458ngm$e52@nnrp3.news.primenet.com>
Source record: 247958

Hi all. I do my scanning in Phoenix, Arizona and stumbled across something I have not heard before. On 928.9125 I receive strong music broadcasts. There is no DJ or commercials and the music is a wide mix of eras but is all pretty mellow. I am assuming this is some sort of "Muzak" type of thing but am not sure. Anyone else out there encounter this type of broadcast?

406. Wide band RX amplifier recommendations

Newsgroup: rec.radio.scanner
Date: 1995-10-08 00:00:00 UTC
From: n8zrp@bright.net
Message-ID: <n8zrp.15.30781C20@bright.net>
Source record: 247961

I am looking for a widebanded RX amplifier and would like some
reccomendations. It will be used in a rural environment so overload is not
a problem.

I would like the following specs...

Actual RF amplification performed at antenna
Adjustable gain
30Mhz - 470 Mhz (or higher) coverage
Integrated selectable FM BCB trap
Relatively low noise gain

I've seen the RS amps, but was hoping that there was better amplifiers for
the dollar. As these were built for US/Can TV reception, I think these will
only amplify freqs >54Mhz; and I would like the 45Mhz PS band to also be
amplified.

Any further info on the RS amps and/or other brands would be greatly
appreciated!

Thanks!

Try the RS whip for $10. That works better than most things that I've
used. I also have a Diamond RH77, which sells for about $30, and the RS
whip is at least as useful for the sorts of things that I listen to.

The following is a listing of Atlanta, GA frequencies that are still
current, but I have no idea what they actually used for. All I have is
that they are either listed under a general heading of local government
or police. Other than this, they have no further identification.

Here's hoping someone has one or more of these stuck away somewhere and
can specifically identify them.

(PL=LOCAL GOVERNMENT; PP=POLICE DEPARTMENT)

153.8750 PL
453.3625 PL
453.4375 PL
453.6625 PL
458.2500 PL
458.2750 PL
458.3625 PL
458.4375 PL
458.6625 PL
154.9500 PP
155.6325 PP
156.0500 PP
156.0650 PP
156.0800 PP
156.0900 PP
156.1100 PP
156.1250 PP
156.1400 PP
156.1550 PP
156.1700 PP
156.1850 PP
156.2100 PP
156.4500 PP
158.9025 PP
158.9100 PP
158.9175 PP
158.9625 PP
158.9700 PP
158.9900 PP
159.0000 PP
159.0050 PP
159.0350 PP
```

159.0500 PP
159.0650 PP
159.1100 PP

Any and all help with these would be much appreciated.

Try scanning between 141.300 - 141.600 NFM using 12.5 Khz steps. Some of
the frequencies are:

AKL Central 141.4125
AKL South 141.3750

Cheers,
Graeme Williams

Nope, haven't found one yet. I hoped Kluwer would've had one, as they publish the scannerfreq. books, but in vain. And what this newsgroup concerns: it's highly US populated, with some UK visitors.

The York Region Amateur Radio Club presents The 19th Annual NEWMARKET HAMFEST on Saturday, November 11th, 1995 at Huron Heights Secondary School in Newmarket, Ontario.

Admission: $5.00 per person
Doors open to the general public at 9:00 am Talk-in on VE3YRC 147.225+

This is THE HAMFEST. The one all the others are judged by. 200+ Vendors. In addition to all of Southern Ontario's major Ham Radio Stores, generally Yaesu, Icom and Kenwood are there as well . Plenty of parking. Door prizes. Grand prizes. Refreshments available. Extra space for socializing.

Please note: The Hamfest entrance is at the main entrance to the school on Huron Heights Drive.

Vendor Information:

Tables 1,2 or 3: $15.00 each (Note: These are 6 foot tables) Tables 4 & 5: $25.00 each Tables 6+: $50.00 each

Vendors Note: Your ADMISSIONS @ 5.00 per person ARE EXTRA.

TABLES ARE ONLY AVAILABLE BY MAIL. No Bookings will be taken by phone, over the air or by packet. Payment must accompany your registration.

Up until October 21st preference will be given to vendors that attended last year's Hamfest.

Please note our mailing address:

Source record: 247882
Cross-posted to: rec.radio.scanner,rec.radio.swap,alt.radio.scanner

I have a pristine 400 channel cellular modified Realistic Pro 2005 which I
am considering selling (I've too many scanners already and being in Canada,
each is cellular capable, as it's not yet outlawed here).

Problem is that I do not know what its value is but am open to accepting a
reasonable offer given its "out-of-the box" condition.
****
I also have 2 YUPITERU scanners which I would like to sell - the MVT 8000
and the MVT-7100.
****
The MVT 8000 description is as follows:

It is a brilliantly designed front panel angled 200 channel ac/dc unit. It
has a mounting bracket for mobile use and comes with a cigarette lighter
adapter although it can be hard wired. I use mine as a desktop unit in my
office. Due to its small footprint, it occupies very little space on a
desk.

It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency
steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function,
pass memory function, and other normal goodies.

Although seemingly assigned on the front panel by preset factory settings,
searches are categorized to conform to channel numbering as follows:

Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)

Of course, you can change factory settings. It also has a battery save
function.

$650.00
plus shipping
****
The MVT-7100:

Previous posting on the MVT-7100 was as follows and it has everything found on the MVT 8000 and much more including USB and LSB:

MULTIBAND HANDHELD SCANNER 5Khz-1650 Mhz continuous coverage With SSB - 1000 Channel-AC/DC - less than 6 mos. old and hardly used. Includes protective leatherette case.
$625.00 plus shipping

Continuous coverage from 30mghz-2ghz...tunes automatically to the closest/strongest broadcasting signal. Great for situations where you'd like to monitor but don't know the frequency or have a freq. counter available. Paid $360.+expenses less than a year or so ago. Asking $300.00 Used VERY_LITTLE. Excellent condition. Comes with original telescopic antenna, extra rubber duckie antenna, and power adapter (for built-in battery). We used this device for counter-survellaince on someone, who where watching our friends...worked as expected. Excellent for the scanner,radio buff, who already has most of this type of equipment. Comes with manual as well. Optoelectronics still sells this same device in their catalogs and distributors for about $359.00. Can ship COD if need be. Email if interested.

428. Display Backlight on PRO2006, SW100

Newsgroup: rec.radio.scanner
Date: 1995-10-09 00:00:00 UTC
From: ddm@onramp.net
Message-ID: <ddm-0910952305460001@hou03.onramp.net>
Source record: 247884
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

There was some discussion here recently regarding the longevity of the green display backlight on the PRO2006 scanner.

Is the same technology used in the Sony SW100 shortwave receiver? Its backlight remains on as long as the external power supply is attached.

Will continuous use of the external supply significantly shorten the life of the display backlight?

Source record: 247891

Geez, I called Grove about a month ago, and didn't have any problem, getting their catalog. Anyway, if I were you, I'd buy the Monitenna from Channelmaster. The Scantenna resembles the Monitenna, but the Monitenna stands up to the elements, better. The problem of the Grove Scantenna, not being hardy enough, has been discussed in length, in the Ham Radio forum, on AOL. The Monitenna is available from Amatuer Electronic Supply for 39.95, and includes 50 feet of rg-6 coax. Their number is 1-800-558-0411.

P.S. The Monitenna I purchased , had a Motorola-type connector, for the scanner 's antenna input. So, if you have a different type jack on your scanner, such as a BNC, you may want to ask about an adaptor. Otherwise, I believe Radio Shack would have an adaptor. I don't think you would be dissappointed with the Monitenna. I'm very happy with mine, and I have talked to many other's, that are, too. Hope this helps.

Subject: Re: Cleveland Airshow Freqs

The following was posted on Cleveland HamNet:

MONITORING AIR SHOWS

If you have ever been to an air show then you know the thrill of excitement
as the pilots show off there skills, but you could be missing out on the
ultimate thrill, that is actually monitoring the pilots and all of the
communications that go with what goes on around an air show. The following
frequencies have been compiled from various sources including monitoring times
and popular communications, most all have been confirmed.

U.S.N. BLUE ANGELS: ground support 121.90
nbfm rpt. 142.025 in/out 142.625

=== === === === === ===

They will usually use two frequencies during the performance and practices.
Freq "A" will be used when the aircraft are coming stage front and during
the maneuvers. Freq "B" is used by the aircraft not involved in the
demonstration in front of the crowd but setting up for the next maneuver.

If aircraft 1,2,3 & 4 are perfoming in front of the crowd they will be on freq "A". Aircraft 5 & 6 will be on the other channel. Once the maneuver is completed aircraft 1,2,3 &4 will switch freqs. When 5 & 6 start to head for the demo area they will switch to the "stage front" freq.

If all 6 aircraft are involved in the demo then all 6 will be on the "A" or "stage front" channel.

)I haven't seen anything in the ECPA that changes any physics. It
)regulates the actions of people. Just like laws that say you can't
)run red lights - physically you can - but the law says you can't. The
)law requires you to take a different course of action... stop and wait
)for the light to turn green.
)
)Bad law? Could be. But not all of it.
)
)Can I monitor the phones calls on the cable in my back yard?

Curtis, I think you are failing to make a critical distinction between
the three kinds of radiators defined by the FCC:

unintentional
incidental
intentional

Unintentional radiators are things like power switches, motors, etc.
They do -not- intentionally create EM radiation.

Incidental radiators are things like superheterodyne receivers and
computers which intentionally generate and use RF, but do not
intentionally radiate.

Intentional radiators generate RF for the express purpose of radiating it.

I think that anyone who uses equipment which intentionally radiates RF, and does so in such a manner as to extend its operating range onto my property, has donated the ownership of the energy contained in that radiation to me for my own possession, and use. In fact, I have seen receiver circuits published from time to time which have two tuned circuits. One is tuned to the strongest station around, and rectified to provide the power for a TRF receiver tuned to another frequency.

Law all around the land is built on this principle. If "your" fruit tree is allowed to grow over my property, any part of it over my property is mine legally and morally. I can cut it off, if I desire. Or just enjoy my fruit.

RF contained in a cable is not intentionally radiated, only incidentally if at all. There is therefore a distinction made between the examples you give.

BTW, I believe the ECPA is not trying to -change- physics so much as it attempts to -ignore- physics. Look up the law which was nearly passed up in Ohio setting the value of PI to exactly 3. They wanted to force people to perform all computations using a legal value of 3. Naturally, such a law is not an attempt to change physics, only the bahavior of people. Problem is, had they passed the law and forced people to comply, the bridges built using this "new improved" value of PI would fall down.

It would be much better for people to recognize that they have no reasonable expectation of privacy when using radio transmitters. Not even when the signal is encrypted. To do otherwise is turn our backs on centuries of legal principle and philosophy, ie if you put it on my property, it belongs to me.

This principle has been applied to such diverse kinds of cases as even divorce cases, wherein if a man and woman living in a community property state have separate property, say money inherited from the death of a relative, and the money is put in a joint account, it is no longer separate, but community property.

First, there is no way for us to know whether you are actually receiving
images of cellular telephone transmissions. You could verify it by
getting a cellular telephone, making a call, and attempting to receive
it on an image.

You could be reasonably sure that you are receiving images if the
frequency you get the signal on is exactly 21.4 MHz higher than an exact
cellular frequency.

|I am looking for a widebanded RX amplifier and would like some
|reccomendations. It will be used in a rural environment so overload is not
|a problem.

|I would like the following specs...
|Actual RF amplification performed at antenna
|Adjustable gain
|30Mhz - 470 Mhz (or higher) coverage
|Integrated selectable FM BCB trap
|Relatively low noise gain

|I've seen the RS amps, but was hoping that there was better amplifiers for
|the dollar. As these were built for US/Can TV reception, I think these will
|only amplify freqs >54Mhz; and I would like the 45Mhz PS band to also be
|amplified.

Check the amateur radio rags for the _HAMTRONICS_ advertisements, as they have some very good low-noise amplifiers that should fit most of your requirements; they won't have a selectible FM BCB trap, but, nevertheless, I'm sure that their performance won't disappoint you... price range will probably be in the $60-$80 price range... as the selectivity of the tuned circuits won't be very hot, they should have useful gain even into the 30-50 Mhz range...

Hope this info helps, and you can get your scanner to search.

BC200XLT Band Search Programming Instructions
(Also works with BC760XLT)

1. Stop the scanner from scanning by pressing the "MANUAL"
key. This is very important. No search information can
be entered while the scanner is in the scan mode.

2. If you wish, enter a channel with no frequency entered,
and press the "MANUAL" key again to place the scanner on
the empty channel. This is a useful step, which is
explained later.

3. Enter the lower frequency limit of the search band of
interest, then press the "LIMIT" key. The frequency
entries for both the lower and upper limits must be
a valid frequency within the frequency ranges the scanner
is capable of receiving. Otherwise, the result is an
"ERROR" message.

4. Enter the upper frequency limit of the search band of
interest, then press the "LIMIT" key.

5. To start the search, press the "SEARCH" key.

6. The search can be stopped by pressing either the "LIMIT"
key or the "HOLD" key once. Each additional press of the
"LIMIT" key decrements the frequency by the internally
preprogrammed step size for the band being searched.
Similarly, each additional press of the "HOLD" key
increments the frequency by the preprogrammed step size.
To continue searching, press the "SEARCH" key.

7. If during the search, the scanner stops on a frequency of interest, stop the search mode as explained in Step 6. The frequency can be entered into the current scanner channel by pressing the "ENTER" key. This is why it may be useful to perform the search mode with the scanner on an empty channel. To continue searching, press the "SEARCH" key.

8. The search limits are retained in memory until over-written by new search limits.

9. The delay feature can be enabled for all frequencies within the search limits by pressing the "DELAY" key. This allows a delay between the time the received signal drops out and the scanner begins searching again, the same as in the normal scan mode. This can be useful to allow the user time to stop the search if he wants to record the frequency, monitor further, etc.

Other Useful Information:
(Applicable to both the BC200XLT and BC760XLT)

Note:

Doing either one of the following erases the frequencies currently stored in the scanner. Don't do either of these unless you have copies of the frequencies stored in each channel, and you are willing to re-enter all of them.

With the scanner "off," hold down the "SCAN," "2," and "9" keys while turning the scanner "on." This enters frequencies into some channels used during receiver testing and alignment, and enters 000.000 into all other channels.

With the scanner "off," hold down the "MANUAL," "2," and "9" keys while turning the scanner "on." This enters 000.000 into all of the scanner channels.

457. Re: New AOR8000; some questions.

Newsgroup: rec.radio.scanner
Date: 1995-10-09 00:00:00 UTC
From: rats@ih4mp736.ih.att.com
Message-ID: <DG6tE8.50G@ssbunews.ih.att.com>
Source record: 247913

|In the manual it says "Always use the mains charger provided or a
|regulated DC power supply of 13.8V @ 300mA or more using the provided
|DC connectin lead. NEVER CONNECT THE AR8000 DIRECTLY TO THE MAINS
|SUPPLY. " What does this mean?

It sounds like the American equivalent of "Hey, Bud, DON'T YOU DARE
PLUG THIS SCANNER DIRECTLY INTO the 110V AC LINE!" "MAINS" is the
term used by the British-oriented to describe house current.

|"That I can't use the power supply provided and it's sole purpose is for
|charging the batteries? I thought I could just run it off this with no
|batteries.

It depends; sometimes the designers let the batteries function as a kind
of capacitor to reduce the AC ripple of the external DC PS, so as to
reduce the 60Hz hum. In that case, it would be advisable to install the
NiCad batteries...

|It is rated at 12vdc @ 300mA and in the manual the power requirements are
|11-16vdc @ 300mA. Why won't it work.

It should work; as long as the internal voltage regulators within the AR8000
can dissipate the power within their design paramters, your AR8000 should
function. However, the NiCad Batteries may be required to reduce the ripple
of the AC power supply...

Ok by now i know you are thinking what the hell is he talking about??? Well awhile ago i started recieving cell calls on 1110Mhz and wondering why! Because i could never get even cell images because of the triple conversion which eliminates images from even being picked up... so i started thinking.. The cell block only applies to the 832 channel phones i was screwing around with my brand new Micro-Tac Lite and noticed this little sticker that said "832/2412 Channel Operation" so i made a couple of calls each time turing the phone off so it would select a new channel each time it was logged onto the system and i had my Scout with me and sure enough "1109 MHz"!!! Have fun with this new info god this makes ya wonder what there gonna block out next!! Happy Hacking!

Re: BC890XLT...

Have any of you folks tried scanning the 220 MHz Ham band ?
I bought one when they just came out...it didn't scan this band
in the proper step size. (Perhaps they've updated the firmware
since..)

I was also disappointed with the poor sensitivity and selectivity
of the unit. It does not compare to my PRO-2004 and 2006.

There's something about the volume to wieght ratio that didn't appeal
to me too...My PRO-2004 and 2006 have some substance to their size...
the weight feels appropriate for their size...the 890 feels like there
is nothing inside. A look inside revealed that there really isn't much
there compared to its somewhat bulky volume. Keep in mind that this is a
personal 'thing'...not to say that the larger something is, the heavier
it should be as result of the contents...Electronic items just have that
appeal to me.

I like the looks and the VFO control but functionally the BC-890XLT
wasn't a hit in my books.

I see you're a Ham...
Why don't you homebrew an amp ?
Have you looked into the MMIC's ? They are 50 ohm in/ 50 ohm out gain
blocks...no need for input or output impedance matching.
They're very stable and require nothing other than a resistor and
perhaps an RF choke for external components (to bias and decouple the DC
supply). 4 leads...IN/OUT and 2 grounds. DC Power is supplied via the
OUT lead. They are very wideband...something like DC to 1 or 2 GHz.

Avantek (HP) and Minicircuits make these little gems. I used to see
Minicircuits advertise them on the back cover of some of the electronic
magazines.
Look into it. They might be just what you're looking for.
You could incorporate your own BCB traps and step type attenuators
to accomodate your needs too !

O.K. I'm sorry to ask this question. I know it's been addressed in the past. My problem is that I've seen interesting freq's posted here and there but I haven't written them down because they're not in my area. Now if I'd thought ahead, I'd have written them down so that I'd have them when I took a trip and I wouldn't be having to ask now.

Anyway, I'm going to Disneyland. Does anyone have frequencies for me to check out?

K.C.

I have a similar problem with both my BC200XLT and BC3000XLT scanners.
When I am in either my Dodge Dynasty or Chrysler New Yorker, either

scanner will pick out a freq in the 154.xxx range and a light solid noise will start. This causes the scanner to stop on that freq. Sometimes, it will cause a real transmission to not come through. On the BC3000XLT, I can use ATT (attenuate) to block it out.

What's weird is that it picks a different freq in that range each time I get into the car. It only happens to one freq at a time. The car can be moving, stopped, or parked and shut off. It happens the same way on either scanner and either car. If I put my hand or arm near the antenna, the sound stops. The sound only occurs inside the car to about 2 feet away. It happens on all sides of town. Sometimes, I get lucky and it doesn't happen at all.

Anyone know what this is? I have all power equipment (windows, doors, etc) in both cars, but like I said, the problem continues after I shut off the car. This has not happened yet in my wife's Dodge Intrepid.

Gary - Milwaukee WI.

You can use the AC adaptor by itself to power the radio. I think
that what is meant by MAINS SUPPLY here is a reference to the wall
outlet voltage, and you obviously wouldn't want to run 120v AC into
your receiver. (I think, but am not positive, that the term MAINS
SUPPLY is used in the UK to refer to common household voltages)

-Steve

471. Uniden BC-170 question

Newsgroup: rec.radio.scanner
Date: 1995-10-10 00:00:00 UTC
From: wb9omc@constellation.ecn.purdue.edu
Message-ID: <45etpf$9lq@mozo.cc.purdue.edu>
Source record: 247836

Yeah, I realize that this is a pretty Jurassic unit, but it does still have its uses (right alongside my PRO-2006).

I have the service manual for it, which is perhaps notable more for missing information than for what is there. :-)

To be more specific, the microprocessor is an 80 pin unit - but a rather substantial number of pins have no function listed either on the schematic or on the diagram that purports to show the "description" of each pin.

While I know from quite a long time doing electronics that it is by no means unusual for a few pins on a big chip to be non-connected, the number on THIS chip would seem to be QUITE large, 27 out of 80. Seems a bit much, to me.

The manual describes this as a "UC1115" (MICOM). Anybody out there have a FULL pin description?

(just a guess - one big patch of unlisted pins is 15 pins in a row, which suggests that those 15 and the next one are part of either a 16-bit wide I/O port, or as is not uncommon for certain kinds of microprocessors/controllers, 2 8-bit I/O ports side by side. And, 73 through 80 inclusive are not described, although 78, 79 and 80 show on the schematic as ENABLE, DATA, CK (clock, no doubt) respectively.....suggesting perhaps interrupt inputs, in this case, all from the PLL.)

Carrying on from there, some of what the pins are described as doing is interesting in and of itself, because it does suggest some possibilities. For example, pin 69 is listed as a High/Low pin that selects 16 or 20 channel memories. This radio was sold as a 16 channel scanner - but since I don't see an external memory IC anywhere, I wonder if it really *could* work with 20. The assumption is that this (presumably custom) micro IC has the capability to go to 20 and is simply held back from doing so. Possibly the same chip used in more than one radio with different features might be a good guess.....

And there is at least one pin that doesn't list anything in the description, pin 17. But the schematic clearly shows it tied to ground and labelled "KP" with a bar over it, suggesting that this is a true-low logic input. To do WHAT is a good question.

Has anyone out there ever played around with this unit to find out if there is a bit more to it than what was advertised/what meets the eye?

MM>)
MM>)I haven't seen anything in the ECPA that changes any physics. It
MM>)regulates the actions of people. Just like laws that say you can't
MM>)run red lights - physically you can - but the law says you can't. The
MM>)law requires you to take a different course of action... stop and wait
MM>)for the light to turn green.

This is a wrong reading of the laws. The laws concerning red light so
not say you can't run them. They say you are not *allowed* to run them. A
big difference. The reason behind these laws is a good one: we need to
control traffic, or serious physical and financial damage will result. This
is a valid reason.
The laws concerning cell & cordless phones also say we
aren't allowed to monitor them, but for a specific reason: that they are
private. In fact, they are *not* private. This is *not* a valid reason for
making a law.

MM>)Can I monitor the phones calls on the cable in my back yard?

Yes, as a matter of fact, you can. There is no law saying you *can't*.
There *are*, however, laws saying you are not allowed to.

If you are going to do this, you have to ask the right questions.

: >Court (if then).

The FCC premption covers ALL such local laws as long as you are using
a transciever. A good choice for a combined scanner/transciever is
the ICOM 2SRA which is (was? is it still being made?) a 2 meter trasciver
with full receive from 30MHz to over 1000MHz.

: Not only that - many of the scanner laws which exempt amateurs are
: written to allow tranceivers which also happen to have wide receive
: coverage. Some laws state this explicitly while other laws just say
: 'amateur equipment'. It would be risky expecting to be scanner
: legal just by having an amateur license...
: Tom, N0YGT

Just a minor point...none of the state laws with Ham exemptions have
or state anything about the equipment. The few such laws are very
specific as to hams being exempted from the laws without any
reference to trascievers, or any other types of equipment.

More local laws (city, county, etc.) may have other situations, but
I've read all the State level laws and they are as I have identified
above.

Nope. Sunnyvale hasn't gone "trunked" yet. You may be thinking of the City
of Santa Clara. Sunnyvale PD is still on 482.9625 with PL of 141.3. Tac
traffic takes place on 483.1625 or on cell phone. The Fire Dept is 482.7125.
If you're using one of the Unidens you may find it convenient to tune
21.7 Mhz above to get rid of images from plant security operating on
460.0125 that can be quite irritating...

FOR SALE:

AOR AR-2515 desktop/mobile scanner/receiver. Predecessor to the AR-3000A.

5-1500 MHz continuous coverage, no gaps.

1984 channels in 62 banks (!) (32 channels per bank) plus 16 search banks
that can be reprogrammed to search select freq groups (like 869-894 MHz).

Has Narrow FM and AM modes, as well as Wide FM for broadcast audio, etc.
Selectable attenuation, and triple-conversion make for interference free
reception and quality sound.

RS-232 connector for computer control.

In excellent condition with AC adapter, antenna and manual.

$400 includes FedEx COD.

Please respond via email to archer55@aol.com if interested.

Thanks!

Good News: Yes, there is. My batteries use to last 3-5 hours, now they
last 11-13 hours.

Bad News: A local electronics store did it for me. I don't have a clue
how they did it.

At least you know it can be done and can keep asking around!

Hi Noel,

Please check out the Uniden "Sportcat" SC150. It's 29MHz thru 956 MHz.
Small, has great sound and less exspensive then the Radio Shack ones.
I have one and I think its great. It has all you need and more.
Good Luck on your search.

Hi Y'all

I'm in the market for a mobile scanner and was considering the BC-700 or the BC-350. Has anyone out there had any experience with either of the two? I understand that both models have preset frequencies (i.e. police, fire, ems, etc.), but how easy it is to program your own frequencies? Features that are important to me include: loud, clear audio and easy of use while moving. Are there any other scanners that I should look into? Thanks in advance!

Hi Mark
Have 9000 and 3000 here and I just listened to both radios at 400 Mhz police and scanned all low vhf, high vhf and other uhf stations with and without pl 's and I can not notice a diffrence in the audio. Here in Cincinnati 460.025 to 460.500 are real busy with city and county police. In Northern Kentucky they use the 453 mhz band and I do notice a tone in their signal but not on all stations. I also have a 2006 and a r 7000 but dont notice any strange tones there either. I have an AR 8000 that picks up the low end of the audio frequency (similar to having the tone control turned down or off) with that radio I do notice the pl or transmitt tones. They are annoying and can overpower a weak voice - but only on that radio.
I use a sp 940 external speaker on the 9000 and stereo cd headphones on the 3000.
Of all the radios I own and have tested the 3000 and the 9000 are my favorites. With your 9000 listen between 360 - 385 mhz change modes to AM and search at 5 khz steps. Let ne know what you think.

Source record: 247857

I had a similar problem as Gary's when I attempted to use my Pro-43 in our new Subaru Wagon. It would lock up on 154.31 initially and then as I drove lock on lower frequencies in the 154.XX range. After about 15-20 minutes of driving all frequencies would be clear. I always attributed it to one of the computer sensors that was oscillating at that freq. and then change freq's as the vehicle, and whatever was being sensed, warmed up. It is somewhat annoying but fortunately for me I do not drive that car much, it's the wife's, when I use the -43. Usually on vacation, etc.
I also have a lock-up in my vehicle, '90 Nissan Pickup, on 46.16 MHz when I tune the FM radio to 92.1. My solution was to not listen to 92.1!
I know that this did not provide any fixes, but at least you know you are not the only one having problems. I guess computers are not always our friends!!

From: minesg@aol.com
Message-ID: <45g3ng$ht0@newsbf02.news.aol.com>
Source record: 247860

Which scanner are your receiving the cellular on? Is the PRO-2042 even in the stores yet? My local Rat-shack ain't got 'em yet! Is it really a triple conversion scanner?

The reason I ask is that I have the PRO-2035 and although the catalog indicates that it
uses triple conversion, the user manual appears (based on my very limited knowledge) to suggest otherwise. Nowhere in the manual are the words _triple_ or _conversion_ to be found. In fact the specification page shows the following IF frequencies: the 1st IF is 609.005 - 613.5 MHz and the 2nd IF is 48.5 MHz.

The cellular calls that you, myself and others are getting between 1105 and 1115 MHz are IMHO images. In fact if you search a little below 1105 MHz you will find other 800 MHz non-cellular traffic. However, the reading you got on your Scout does pique my interest. Has the FCC decided to give over some more of the radio spectrum to the cellular industry?

All this creates another question. Given the IF frequencies for the 2035 how does one
compute 1105 to 1115 MHz as being the area where one would get cellular images? My first scanner had an IF of 10.7 and determining if a received frequency was an image was pretty straight forward. Double the IF to get 21.4 and add or subtract that value from the received frequency. Does this formula not work for triple conversion scanners? Does the 2035 use triple conversion or not?

I think what is needed here is someone who really knows what they are talking about. I've got questions, who has answers?

Dazed and Confused,
Nebraska

TN> necessarily mean that a scanner will pick up signals (iwhen nothing is
TN> near the signals) better then a scanner with better sensitivity and
TN> worse selectivity?
...
Why not ask a *hard* question?? ;-)
OK, I'll take a stab at this...
Sensitivity is usually listed in microvolts. What this means is that a certain level of signal, measured in microvolts, will allow the received signal to be heard above the noise floor.
Let's pick a figure: 400 microvolts, and say that's the sensitivity of radio A. That means that radio A will allow you to hear a signal that is 400 microvolts strong at the antenna input.
Now, let's make another radio (radio B), and give it a sensitivity of 200 microvolts. As you might suspect, radio B will allow you to hear a signal of 200 microvolts at the antenna input.
Back to radio A.
It has a selectivity of 40 dB. This means that, while tuned to a given frequency, any signal on an adjacent frequency will be 40 dB below the primary signal.
Radio B also has a selectivity of 40 dB.

Still with me? Good...

Now, radio A and radio B are both tuned to the same frequency. A signal comes in (over 400 microvolts, so it can be heard well). A signal also comes in on an adjacent frequency (also well above the sensitivity floor). Radio A will hear the primary signal, while trhe adjacent signal will be 40 dB down. Radio B will also hear the primary signal, and the adjacent signal will also be 40 dB down.
The difference is, on radio B, since the sensitivity os better, both signals will be louder, making it harder to distinguish the two, even though on each radio the adjacent signal is 40 dB down.
To illustrate: if you have two people talking near you, and one is legible, but the other is too quiet to be legible, the first will be very legible, and you will be able to hear that person very well. Now, if each person gets louder by the same amount, it will be more difficult to understand what the first person is saying. Same with the radios.

Problem: sensitivity and selectivity are related, but not the right way. As sensitivity gets better (the level goes down, meaning more sensitive),

selectivity gets worse. Yet, as selectivity gets worse, the audible signal is harder to understand, so this is no good. Correcting this is difficult (read:expensive). Otherwise, there'd be no problem hearing WAR in San Francisco; just hike the sensitivity enough, and it's possible. Problem is, selectivity gets so bad that the noise floor rises to the point that you can't distinguish anything.

In scanners, sensitivity is already so good that any increases would increase the noise floor too much. Also, as sensitivity goes up, other problems show themselves, like desense (where a strong signal, even far away from the tuned frequency, overwhelms the front end, effectively shutting it down, and the radio hears nothing), intermod (two or more frequencies mixing before the front end, producing a caterwalling noise you are sure to remember), and images (false signals usually related to the first IF). And, of course, poor adjacent signal rejection. Another leap in technology will be necessary before this changes much.

Different scanner makers have differing solutions to the problem. Radio Shack, for example, has usually had their scanners made just a little less sensitive than Uniden/BC scanners. This means that, in urban settings, Radio Shack scanners are less prone to desense and intermod. In outlying areas, on the other hand, Uniden/BC units as a rule, will pull in the signals better than a comparable RS unit.

(I will point out here that as time goes on, and technology, and the costs of technology, changes, this may well change. It certainly isn't meant to be an endorsment or condemnation of either maker, but rather an illustration of differing solutions to the problem, and their meaning to us as scanner users.)

As a practical matter, in most modern scanners, selectivity is good enough to not be a real problem, except in extremely adverse conditions, no matter what the sensitivity is.

I hope this helped a little.

No problem:
RAMSEY
1-800-446-2295

The item you are looking for is the SS-70 SPEECH DESCRAMBLER-SCRAMBLER. It's
a kit (manufacture or importation of the assembled units is illegal), and
the cost is $39.95. A case (#CSS) is $14.95.
These are very easy to assemble. I mean *very* easy. Quality is sort of
so-so, but it will work. I have one, and it does the job. There's some
introduced noise, but it doesn't interfere with the functionality.
Hope this helps.

Sorry, 1109Mhz is *not* a cell phone frequency. On the 2035, this is a
well-know characteristic (receiving cell phone images in that range). It's
been documented many times. While it is not an actual image in the common
meaning of that term (2 X [1st IF]), it is an image.
I hava a spectrum analyzer, and will be willing to show you, if you are in
the Phoenix area.

I haven't been to Disneyland in 10 years. I am going this weekend but won't be taking my scanner - just more junk to haul around. But...

Are the 460 freqs still good for Disneyland? Last year we had frequency coordination problems effecting our 900MHz trunked system in El Segundo - Disneyland was installing a 900 trunked system and co channeling with some of ours, causing trouble for us. Does Disney have any of their 900 system in service yet?

Work on cellular communications started back in the 60's or
early 70's (believe it or not). I seem to remember being told
that the AMPS standard we use for analog cellular in the US was
developed established in 70's also. Digital at that time was
probably too big and expensive to make it practical.

I don't of any carriers that are running CDMA in the U.S.
just yet. TDMA cellular is running in U.S. in several markets.
CellularOne is aggressivly marketing digital service in
California based on TDMA.

All Military aircraft now use C3 systems, which are digitally encryped, and therefore not monitorable. However, prior to their advent, I had the following freqs in my list:

USN Blue Angels :
Gnd. Support - 121.9 Mhz
Rptr - 142.025(in),142.625(out)
Common Airshow Laison - 123.4
Main - 143.60

USAF THUNDERBIRDS:
Gnd. Support - 413.025 Mhz
Operations - 120.45
Air to air - 140.40/141.85
common Laison - 123.4

USA GOLDEN ANGELS:
Operations - 32.30 Mhz
Primary - 42.35
Common Airshow Laison - 123.4

As far as the charger goes, I interpet the manual the same as you do- my guess is that the charge circuitry can't handle the running load, but is sufficent to trickle charge the AA cells overnight.

Scanstar Gold is the only program I know of to modify the AOR 8000 code.

Call EEB's BBS for more info. (703) 938-3781

>
>
>-> bh

I think the K55 is an older K band radar. If memory servers me, 24.150
is the operating frequency and is samck dab in the middle of a ham
allocation. If you get an Xband 10.125 just retune it down into our
Xband allocation. You might have to wire in a cw ider, you know for
"beacon" operation. Of course the cw id tone might drive other in
band radars ought of their mind. The front end on radars is frightfully
simple. You have a transmit oscillator feeding the waveguide/horn,
and a "hole" in the wave guide to couple both transmit and reflected
energy into a diode and the output from that goes to an audio chain...
A modulated Xband ham source can be heard on a typical police radar
at a good distance. Most people don't realize that a cop can hear
the dopplar returns. It sounds like a bunch of tropical birds(on LSD).
Ask you officer friendly to for a "ridealong". Be sure to pick a cop
with a radar. You will be amazed at how different objects sound.
Large flat ones are LOUD, some cars have a real small (quite) return.

>
Well, they're kind of passive. They use "Super Heterodyne". ie.
Intermediate Frequency. The VG-2 Detector Detector goes after detectors
IF. It gets worse. The radar detector manufacturers countered with
"stealth" radar detectors. They used a different IF than the VG-2 was
tuned to. BEL actually developed a radar detector detector DETECTOR!! It
detected the VG-2's IF and then adjusted it's own IF to foil the VG-2
while alerting the driver. Can a detector detector detector detector be
far off?? Actually it cracks me up that the police spend so much money
trying to catch people speeding and using radar detectors. Just think,
they could actually be catching real criminals. Those damn speeders, you
know. Worse than child molesters!! I can just see a "scanner detector"
coming after a new round of ECPA.

Go for it... you can't beat a pro2006 with anything in it's price range..
It can be easily modified by clipping the diodes:
D502-- to allow cellular
And, D503-- to increase scan rate to 30ch/sec
Cellular is in the 869-894MHz range.
Good luck!

Scanner for sale

Radio Shack PRO-32A Handheld scanner $150 (cost $300 new)
200 Channel Programmable Scanner with 10 banks of 20 channels
Covers
30-54 MHz
108-174 MHz
380-512 MHz

Scans 8 or 4 channels/sec.
Light does not work, otherwise in very good condition
Runs on 6 AA batteries or 9V AC adapter (Adapter included)

In original packaging with original instruction manual

I will include the 1989 Edition of Police Call, Volume 7 covering AL, AR,
LA, MS, OK, TN, and TX
I will also include Betty Bearcat National Police Frequency Directory

The closest current RadioShack model is the PRO-62 Which is the same but
scans faster at 25 ch/sec. and gets some of the 800-900 MHz bands.
The PRO-62 Sells for $299

E-mail me at dwbaugh@whale.st.usm.edu if interested

Whoa!!! Does this price include a bottle of vaseline??

I've seen PRO-39's go for that kind of money and they have 800 mhz
capability, potential for a cell mod, and hyperscan (25 chan/sec).

But it's difficult to estimate the actual value of the scanner in
this deal since frequency directories are included. :)

BTW: New PRO-39's were $299 & Radio Shack closed them out at only $185 a
few months ago...

532. Information about Comtell 102

Newsgroup: rec.radio.scanner
Date: 1995-10-12 00:00:00 UTC
From: ultima@box.nl
Message-ID: <45k3i9$uvn@box.nl>
Source record: 247800

Hello folks,

Is there anyone who knows where i can get information about the
Commtel 102 handheld 10-channel computer-scanner.
I'd like to change the bandwidth and i want to know if it is possible
to create more channels.
So in short: I LIKE IT ALL....

Thanks,
Aad van Boven
The Netherlands

533. FS: Motorola Saber c/w charger, mic, & extra battery

Newsgroup: rec.radio.scanner
Date: 1995-10-12 00:00:00 UTC
From: lmilrad@passport.ca

Source record: 247801
Cross-posted to: rec.radio.scanner,rec.radio.swap

Securenet VHF Saber (Model H43QXK7139AN) in excellent condition, both cosmetically and operationally, with new antenna, 2 new batteries, belt clip, rapid charger, and microphone. Will only sell as a package for firm price of $1000 plus shipping charges OR will consider trade for 800 MHz MT 2000 or possibly 400 MHz MT 2000.

534. FS: Yupiteru MVT 8000 all-mode scanner

Newsgroup: rec.radio.scanner
Date: 1995-10-12 00:00:00 UTC
From: lmilrad@passport.ca
Message-ID: <45klt0$c0a@diplomatic.passport.ca>
Source record: 247802
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner

The MVT 8000 description is a brilliantly designed angled front panel, 200 channel ac/dc scanner. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on my desk.

It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.

Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:

Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)

Of course, you can change factory settings. It also has a battery save function.

$650.00
plus shipping

I just noticed Radio Shack's top of the line handheld scanner, the
PRO-26, is on sale. It covers from 20 (or so) Hz to 1.3 gigahertz
minus cellular freqs. It has super fast search and hyperscan.
Any experience with this scanner? How about mods to restore the
"missing" freqs?

Thanks in advance,

Bob

From: cutter@dallas.net
Message-ID: <45ldbp$5nj@dns.plano.net>
Source record: 247805

Shortly after purchasing this scanner I learned that there was a software problem that resulted in not being able to lockout frequencies. I sent it back to the manufacturer to have the software update, and got it back yesterday after 2 weeks. Guess what? It STILL doesn't work! I don't frequent this group often, but has anyone else had similar problems? I've tried LOCKOUT, DATA SKIP ON, ...

Any recommendations on another brand of mobile scanner should I decide to request a refund?

Thanks!

I previously had an ICOM W2A. The W2a is a 2 meter 70cm tranceiver that
that has a wide band receive from about 100 to 900 mhz. The specifications
on the wide band receive are not guarenteed! This means that both you and I
could own a W2a, and my receive of 500mhz or any other frequency for that matter
may be better than yours. The wideband receive is there, but ICOM does not guarentee the
specs. Even with all of the Shortcomings, I wish that I still owned by
W2a.

Pro 2006 uses an EL panel, which fades over a relatively short time.

SW100 uses green LED(s), which don't.

Cloning cell phones is HIGHLY illegal, no matter what it is used for. A person that is close to me wanted to do the exact same thing you want to do, and was unable to do it. Any semi-honest cell phone dealer will NOT clone a phone for you. It may sound stupid but it is for your own protection, people would be cloning phones left and right if dealers were that flexible.

Source record: 247873

Hello Everyone,
I have aquired a Uniden UBC2500XLT scanner. Unfortunately the previous owner had lost the manual (which sort of explains why there was only about 30 Channels programmed in it). What I would like to know is-

1 - is there any way of selecting a 'Non-Standard' mode at a particular frequency. eg Wide FM at 400Mhz

2 - is there a way of clearing a bank of frequencies in one hit.

3- Any other neat stuff.

I already know about holding down the following groups of keys and turning it on

2,9,MANUAL Clears everything
2,9,SCAN Enters 'Test' Frequencies
2,9,LCK Displays a Software Version
2,9,L/O Displays all LCD Segments

553. Radio Image Question

Newsgroup: rec.radio.scanner
Date: 1995-10-12 00:00:00 UTC
From: wjd@pi.btv.ibm.com
Message-ID: <45jb7v$odq@mdnews.btv.ibm.com>
Source record: 247879

Hello,

I have a two stage scanner which uses 10.8 MHz and 450 kHz as the intermediate frequencies. Am I correct in guessing that images may be heard at any of the following four intervals?

+10.8 + .45 = +11.25 MHz
+10.8 - .45 = +10.35 MHz
-10.8 + .45 = -10.35 MHz
-10.8 - .45 = -11.25 MHz

Is any one of these more or less likely to produce images?

As an example, our NOAA weather is at 162.40 MHz, but while searching I found an image of the station at 172.75 MHz (which is exactly 10.35 MHz higher). I know it was an image because the broadcast frequency is periodically announced. I did not find any images at 151.15, 152.05, or 173.65 MHz as I expected.

Can anyone help me understand this? Thank you.

>the same telephone number.

This is a very un-wise course of action. Under Title 18 of the USC section's 1028 and 1029, The use of cloned cellular phones is considered fraudulent.
A number of Cellular providers are now offering rate plans that would allow you to have two or three phones work off of the same number. Any phone will work under these plans and they would still have their individual ESN's intact. By cloning your phone and using it in a network where this type of service is offered you would be commiting fraud against the carrier. I am not telling anyone what they should do, but it would be prudent to check out all the facts before doing anything that could possibly be illegal.

>via its built in CI-V interface and tune my Icom R7100 as well.
>
>My question - Can I use the CI-V interface I bought with the Icom to connect
>the Aor8000 to my computer?

Not without modifying the CI-V interface.

>From what I gather - the cable connector mod
>is only OUTGOING data when in AOR format.

You're sounding confused. The mod is done to the AR8000 and not the
Scout. The interface on the Scout is already CI-V compatible and is
bi-directional. It will already work via your Icom CI-V interface to
allow your Scout and PC to talk to each other in both directions
without any modifications.

The AR8000 mod is an INPUT to the scanner and not an output. It allows
data to be RECEIVED by the AR8000 and will not allow data to to be
sent FROM the AR8000.

The ideal solution to this, and one I have carried out with success,
is to carry out the mod to the AR8000 but to use a stereo jack socket
instead of a mono one.

What you then do is connect the AR8000's RX data line AND the TX data
line to the tip and ring of the jack socket.

That way you get both lines through that socket.

When you want to use the Scout you use it as indicated in the
instructions and as per the mod.

To allow your AR8000 to talk to yout PC, and vice versa, you would
plug in a stereo jack plug to the AR8000 and route that to your PC via
a suitable interface.

A suitable interface can be made for about $10 or so or you can do a
minor modification to your Icom CI-V interface to allow it to function
the same way as the CU8232 and similar interfaces do.

>Does this mean if I choose CI-V mode on the AOR instead of AOR mode
>that I can connect my Icom interface between my computer and the
>AOR8000 and so save the $100 - 125 needed to buy one of the three
>"AOR-approved" interfaces?

The AR8000 doesn't HAVE a CI-V mode.

My understanding is that you can purchase scanners in Canada that are cellular capable(at least for now), but they are considered contraband by U.S. Customs, and could be confiscated if you try to bring them across the border.

I don't know if the RadShacks in Canada sell cell-cap units.

Ok, I live on floor 23 of a 30 floor condo, nowhere to mount an outdoor ant. What's the best ant to use indoor, or for the inside of my car. I have a corvette convertible, no roof, no magnetic surface.....???
Also, does anyone know about the 6400 channel mod for the 2006? The antenna Q's are most important here...any help would be greatly appreciated. HI TO ALL YOU T.O. DWELLERS....Any new freq's in the Toronto area? I found the drive through at Tim Hortons (DVP and Sheppard) on WFM 921.*****.

561. Price Patrol

Let's get a debate going on scanner prices and the price patrol. There are lots of people here, myself included, who have an idea of what something should sell for (and I suppose what something is really worth). I've sold a BC200, AOR1000, PRO2006 w/ Opto interface and PRO51 through this group. I got the prices that I wanted and the buyers, I presume, think they got a good deal. But let's talk about prices and see if we can come up with an acceptable range for some of the more popular scanners. If nothing else, if there is a consensus on what something is worth, then the price patrol can be damned, right?

And what about the price patrol? Who in the hell are these folks and what makes them so smart? Think those guys who sign off as the Captain, Chief or General in charge of the Price Patrol are really scanner savvy or are they low-balling jerks who doesn't know their butts from buttons?

To start the ball rolling, I say a fair price for a PRO2006 in mint condition is $325. A mint Icom 7100 (no gaps) is worth $1600. A BC200 with cell mod in mint condition is worth $175. I base my prices on desireability of the unit, cellular capability and of course, condition (mine are always perfect because I'm Morris the Cat finicky).

Don't waste time flaming me if you don't agree with my prices. Put your two cents worth in and let's get the equivalent of a Blue Book going...

Source record: 247739

Folks, I just sold a Pro-51 (with cellular via keypad) so I
could buy a Pro-43 (modded for cellular)...now granted the
43 is a nice scanner but I actually miss the 51 and wonder
if I did the right thing....the 51 had the built in band search,
fire, marine, air etc which came in handy on the road a lot.
Also, the display was bigger and had a nice delay...no need to
hold the light key down forever....the audio was clearer and louder
on the 51 too. Sure, there's lots of mods for the 43 but you better
be sharp with a soldering iron.....the room inside is TIGHT! talk
about meticulous modding...whew. If your not into taking your
scanner apart and risking killing it...and you don't feel you
need the military band then the 51 is great little unit. I'll
miss it...maybe someday I'll buy another. Until then I'll rough
it with the 43 heh heh......

Would anyone know if there are any mods for the BC2500 and/or
the BC3000. I am thinking about purchasing one but I would like to
know if they can be modified in any way. Such as speed, channel
capacity, 800 Mhz band, etc.. I've been reading other comments about
these radios such as sensitivity issues and the comments have
very helpful. Please keep the opinions and comments coming.
Any help would be appreciated.

Thanks - John

Situations where tiny size is the ONLY consideration.

>which is the best antenna for the R1 ?

The one that it comes with. It is deliberately deaf.
An antenna having more gain will run the risk of adding to overload and
false image problems.

>Cloning cell phones is HIGHLY illegal, no matter what it is used for.

I would like to see anyone come up with the actual law that states that cloning is illegal. Some states have separate laws that do prevent this but there is nothing from a Federal standpoint. The only thing that I have ever come across is several FCC rules that state such things as altering the ESN by any method other than the manufacturer's speficitation is illegal. If someone is using the same method as the manufacturer then it is not Illegal. This is how most places clone phones.

Now to actually answer the mans question without playing parent for him. Give CelluSoft technologies a call at (619) 399-6390. I have found them to be quite reputable. They can help you with your own phone as well as helping others while making some money for yourself.

>From: hotrod@vnet.net

I own a Pro-43, Pro-26, Icom R1, AOR-8000, Pro-51, Pro-34, Pro-2006 and
Yupiteru MVT-7100. By far, the best is the Yup. NOTHING comes close for
sensitivity and selectivity over its CONTINUOUS range from 100K to 1.65G.
Add to this 1000 channels, 10 search banks, 500 search pass frequencies,
an excellent light(that lights the keypad too!), and the best audio I've
heard from a handheld. It is also supplied with a belt clip, hand strap,
earphone, 4 NiCads, AC adapter and car adapter. I always recommend this
scanner to anyone looking in its price range($540 US).

I've done extensive comparison between my scanners and would rank them
1. MVT-7100
2. AOR-8000
3. Pro-26
4. Pro-43
5. R-1

If price were the major consideration I would give the thumbs up to the Pro-26
since it has most of the features of the MVT-7100(but not all) and can be
had mail order for about $340 US(probably slightly more if you get a Eurpoean
version w/o the cell block). Can't recommend a Pro-43 because you're not
likely to get ahold of one these days. Even if you could, the slightly higher
price of the Pro-26 is justified by the wider frequency coverage and the
several
new features.

I stay away from the Uniden's because of the rechargable batteries(to me
they're
a pain - I get enough of recharging with my Ham radio batteries!). And I love
the UHF TV stations because I can always tune in to the news - like when
8 of us at work were huddled around my scanner awaiting the outcome of
the OJ trial.

Enough said...

The Euphoria Tape

Do The Euphoria Tape alone the first time, and then
with a lover. It's a phenomenon you will feel within
the first 3 minutes of use -- what you feel the rest of
the time is unbelievable.

The Euphoria Tape.

It was first whispered about on college campuses, and
only experimented with in seclusion, or among close
friends in private settings, but it has now become a
cult rush and is considered the next passion of our
Cyber lifestyles.

The Euphoria Tape.

Not a drug, not a chemical, but an audio stimulation of
brain centers controlling pleasure. And agony. And ecstacy.
The buzz. An audio mesmer signal strokes the base of the
mind, choking out pain sensations and producing the violent
flow of... euphoria.

The Euphoria Tape.

Copies have changed hands from friends to friends to other
friends. It is not regulated, there are no laws yet restricting
use of The Euphoria Tape.

The Euphoria Tape is rushing the masses.

579. Cellular telephone infrastructure questions

Newsgroup: rec.radio.scanner
Date: 1995-10-13 00:00:00 UTC
From: robert-s@ix.netcom.com
Message-ID: <45kdch$cp2@ixnews7.ix.netcom.com>
Source record: 247811

I have some questions regarding cellular systems any ideas??

1) Can one determine the type of cell site layout from the physical cell site location and control channel assignment (such as 3/9 4/12 7/21 clusters)? Can one determine the SAT number by layout?

2) How are future cell sites planned? Are all of the possible cell site locations determined up front or are they incorporated later on an needed basis?

3) If a cell site has three sectors but only one control channel how are the channel sets allocated? How are the control channel allocations determined?

4) How would a technology like CDMA (which uses a different channel size) be incorporated into an exisiting AMPS cellular infrastructure?

5) Why are can a connection suffer from bad reception (particulary for more than 30 seconds) if the SAT tone is looped through for voice channel quality? Especially in lightly loaded cells where a new channel or site is available for hand-off?

6) What exactly takes place when a cellular system is retuned? How long does it take? Is the system down during this process?

7) What happened to D-amps (TDMA) some carriers were pursuing it then stopped? Why is echo such a problem in TDMA digital?

8) Do adjacent cellular carriers work together on channel allocation?

9) Can the cell site "force" a report of the MIN & ESN from the handset?

10) How does air temperature affect 800 MHZ signal propogation on flat land? Is inter-cluster interference more likely at higher temperatures?

11) If a cell site has an overlaid-underlaid architecture how many control channels are used? one or two? Is the handoff between over and underlaid cells done from the SAT level?

Thanks for your help. I appreciate an ideas :-)

Hello

I came across a mod for the Pro43 that enables it to receive 6mhz to
1000mhz. It hooks D1 to D5 and up to the keyboard lock switch to fool
the CPU to allow it to search out of band.

Has anyone else heard of this mod and does it really work?
I thought I had most mods for this radio but this is a new one to me.
Want to get some feedback before I attempt it. It seems a great
mod like this I would of heard much sooner.

thanks
Steve

There is a difference, if the cable is radiating out a signal that
you can receive without tapping into it, then yes you would be able
to legally monitor the signal. In fact, the cable owner/operator
would be violating the law by allowing the leakage to continue.

If you're talking about physically tapping into the cable, then you're
talking about trespassing on private property (the cable), even
though it's on public property (the utility easement).

If there is a RF signal travelling through free-air, that can be
picked up with an antenna, then it is fair game to be monitored. This
is in my opinion.

I happen to be an Electronics Tech in the U.S. Navy, and they have
a simple method of preventing unwanted monitoring: encryption. Even
with as much as I dislike the Clipper set-up, it would prevent the
average person from monitoring their conversation. (Based on current
technology levels.)

I don't really care for monitoring others phonecalls personally, as
most of them are rather boring, but I don't like the moronic methods
non-tech types try to use to stop me from being able to do so.

>can also be intercepted!

I may well be wrong on this, but I was of the impression that listening to the analog phone calls from birds was considered wire-tapping.

Most phone systems today handle calls as digital signals, and many of the links are digital. I think it's getting fewer and fewer the amount of calls that can be monitored over long-haul lines. This is the reason for the Digital Telephony Bill/Law that we should all be aware of by now.

585. Nat'l Freq List on CD

Newsgroup: rec.radio.scanner

I am interested in purchasing a nationwide frequency list on CD-Rom.
I understand that a few companies offer such a CD. Can anyone
suggest one that appears to be accurate and has a friendly inerface?

Thanks in Advance!

Ed, Monitoring San Diego

589. Re: Bearcat BC-700 / BC-350

Newsgroup: rec.radio.scanner
Date: 1995-10-13 00:00:00 UTC
From: rallen8184@aol.com
Message-ID: <45leem$l3j@newsbf02.news.aol.com>
Source record: 247821

I have the BC 700a, and am listening to it, right now. The main reason I purchased it, is because I wanted 800mhz capability in my shack/computer room, and I could leave my other scanner in the living room. I got this for a
steal at a local Kmart. They were clearing 5 units out at 79.00 a pop. I couldn't go wrong. Well, for 79 bucks, the audio is nice, and it receives nicely in my basement, with just the stock antenna. But, there is no direct
entry programming, which really sucks. The pre-programmed channels are okay
if you're lazy, but you can only program 20 channels into each bank, hardly
enough for any serious scanner monitor. At a retail price of 199.00, I don't
feel you'd get your money's worth, at all. The BC 350 is the exact same thing, less 800 mhz coverage. For about 250.00, if you like Bearcat, you can get the 760xlt, which is fully programmable, and has 100 channels. If you're on a tight budget, there are probably other mobile scanners available, that would give you more bang for your buck. Perhaps someone else on the list can provide info on those.

I plan on buying a scanner. I am looking at the Uniden 3000XLT portable scanner.
My questions:

How does Uniden compare to the Radio Shack scanners?

In the long run is a non-portable scanner better for reception and quality than a portable?

How do I go about buying a UK version of a scanner?

Is it possible to modify the Uniden 3000XLT to receive cellular?

If you had $500 to spend what scanner would you buy?

Any help would be greatly appreciated!

Thank you for you time.

Regards,
Joshua Dembling

Current GMRS licensing fee is at $75 for 5 years (this is what I was
told by the FCC Land Mobile / GMRS branch in Gettysburg, PA).

You should have a "sample" application that accompany the "blank"
application from the MAXON unit you've purchased.

>one of the three"AOR-approved" interfaces?

Huh? Are you talking about changing the mode on the Scout40? I don't
know of any way to make an AR8000 use the CI-V protocol, except using
a conversion cable for older Scout's that wouldn't speak to the
AR8000. I don't think that conversion cable would work in the RS232
chain. The CT17 interface you bought for your Icom R7100 doesn't work
with the AOR scanner. The computer interface for the AR8000 is only
$84.95.

The Opto SCOUT (and the newer "Cub") look like nifty devices. Any owners willing to share their experiences?

How (and how well) do these things work day-to-day? How close to various transmitters do you have to be to capture a frequency? How well do they work in an urban environment? Mobile?

And what can I do with a SCOUT and OS456 board (WAVE software?)

Any comments would be welcome. Please Email and I'll post a summary. Thanks.

From: willhelm@ix.netcom.com
Message-ID: <45n1fc$gt9@ixnews6.ix.netcom.com>
Source record: 247755

Hello, and thanks for reading this. A friend of mine and myself just recently purchased 2 Yaesu FRG-9600"S. They are a neat little machine but somewhat limited in their scanning functions. But with the computer control capabilities they can be programmed to utilize more scanning memories and perform functions that most of the modern units will do. Anyway, i am looking for CAT software for these little gems. If your actively using a FRG-9600 with some sort of scanning software i would love to talk to you. There are some outboard converters in use also for these units. They allow you to receive the entire HF spectrum. I would like to find out more about them also. Please email me if your familiar with either of these things.

Many thanks....Bill in Las Vegas, Nv.

Just before logging on, I got a new sale catalog from a company called RADAR SALES, in Minneapolis (612-533-1100). I've bought from them before, and they have all kinds of refurbished and new x and k band radar stuff, I've bought some of their equipment previously, and it is more fun than you can imagine. As I understand it*, due to the low power output on these, no licensing is required.

The featured item in the new catalog is a Stalker sports gun (they sell both police and sports equipment). For about a grand, you get a new Stalker, case, battery, charger, and tuning fork.

They also have refurb stuff. X band handhelds w/ warranty start at about 300 bucks.

There is no RF circuitry in the PRO-43 for frequencies below 30 MHz or between 512-806 MHz. Diode D1 _is_ the keyboard lock diode - it's already connected to the switch. Diode D5 does not exist in the US/Canada model; if installed it would set the cellular step to 12.5 kHz.

609. Cheek3 - The Ultimate Scanner?

Newsgroup: rec.radio.scanner
Date: 1995-10-14 00:00:00 UTC
From: tubegod@cml.com
Message-ID: <ragnaroek1995Oct13.201726.22648@news2.compulink.com>
Source record: 247764

Hi Scanner People!

In the September issue of U.S. Scanner News there was a review of Bill Cheek's latest book, "The Ultimate Scanner - Cheek 3!". In talking to other hobbyists personally, I think that the USSN should be commended for doing and excellent job in reviewing this book. (The USSN can be reached by Emailing ussn@pacifier.com or by snail mail at: PO Box 1923, Portland, Oregon 97214. (503)230-6999. You get 12 issues for 20$ the last time I checked. BTW, I am in no way affiliated with USSN) I think the USSN should also be commended for producing a first-rate publication in a hobby that is seemingly succumbing to more and more misinformation and opportunism. It's refreshing to see a magazine that puts honesty, it's readers' best interests and the betterment of the hobby first. With that in mind, I'd like to take this opportunity to talk a little about the review, some of the points that were brought up in it and my own findings with Cheek's "World Scanner Report" newsletter and his behaviour online.

The overall picture that the reviewer paints is that the book focuses mainly on the PRO-2004,5,6 and PRO-43 scanners from Realistic (Tandy). It was noted that ALL of these units are now defunct. The reviewer makes a point of mentioning that NO current scanners are covered in the book at all. In fact, he suggests that more befitting titles could be, "Too Little Too Late" and "The Ultimate Hype". Cheek has referred to Radio Shack as "Radio Schlock" in the past so it seems rather hypocritical that he would (essentially) dedicate a book to their products. However, from his WSR newsletter it would seem that Radio Shack does not ask Cheek to review their new products. In fact, Cheek relies on his readers to break copyright law by faxing him technical information on these new products. (see June WSR re: Realistic PRO-60 and also outlined in my review of same). I mention this because several months ago Cheek went into a lengthy dissertation on here speaking about how copyright infringement hurts everyone. Folks, if this isn't the ultimate in hypocrisy I'd like to know what is.

The review says that Cheek describes how to increase the number of memory channels of your scanner. I've personally seen a couple of Realistic units that have succumbed to these types of mods. They were nothing short of a complete and total cosmetic bastardization. One of them was down at Dayton, Ohio a couple of years ago. I've never before seen so many 10 cent LEDs and rotary selectors glued into reamed-out holes on any such abortion! They leave the scanner in a very "hacked" looking

state. It is easy to design such a modification that will not require holes drilled in the cabinet of said units. In fact, I've designed one myself. I also have to question Cheek's expertise in this area as he's said in the past that he's not up on the serial EPROMs one of his respondents talked about.

The reviewer notes that a large part of the book deals with Cheek's CE232 interface for, once again, the PRO-2004,5,6 scanners. Cheek charges 200$USD for the CE232 "kit" and it comes with nary 50$ in parts and instructions (which will take you hours to follow) to install it in or beside your radio. The reviewer doesn't mention if Cheek compares his unit to the Optoelectronics 456. I suspect he didn't though. The Opto' unit takes "charge" of the scanner and replaces it's "intelligence" to increase the performance thereof (while adding things like PL tone decode, expandability etc.) whereas Cheek's CE232 merely mimics keystrokes and reads data that is dumped to the display.

The reviewer notes that Cheek talks about the relationships that should exist between scanners, computers and the hobby in general. I suspect that Cheek hasn't had the pleasure of using an AOR-8000 or any computer controlled receiver/HF transceiver (legally or otherwise) as his kind of thinking would be current only if it had been written about five to ten years ago.

Apparently Cheek talks about building an SCA adapter for use with, you guessed it, the PRO-2004,5,6 scanners. The reviewer notes that many other scanners can receive the FM broadcast band and could make use of this SCA decoder. This is true. Actually, the SCA decoder should work in pretty much any FM broadcast radio ever made. I've found personally that SCA information is not very interesting. If one has an FM portable radio and an HF receiver capable of getting down to 50Khz (very long wave) you can use it to decode the SCA information. This is without the benefit of an SCA decoder and will cost you no extra money. This ought to satisfy the curiosity of most people. In Toronto you can buy a portable radio that will decode all the SCA broadcasts too. It will cost you just about as much as, say, the Ramses kit and you won't have to build it. Also you can take it back to the store and get your money back after you get sick of listening to foreign-language talk shows, stock transaction data, digital paging and elevator music. I must admit, this may seem like a bit of a pessimistic view and I'm all for people learning more and more about radio electronics. However, the concepts of SCA can be easily conveyed to the scannerist who has a basic understanding of frequency and modulation techniques. So the education that results from building and using an SCA demodulator is really quite dubious.

The reviewer mentions there are cellular restoration modifications for about 24 scanners. He also mentions that only four of them have accompanying pictures. I find this interesting to be sure. If I was putting out a book specifically on modifications that I'd engineered, I would take the time to draw simple diagrams - or even take pictures - as I went along. It should be noted that most modifications found on the online services and amateur packet radio are text only too and graphics quality is often very low (or absent). Given that Cheek doesn't appear to (or even claim to) own many scanners we could extrapolate that most (if not all) of these picture-less modifications are not his own, not tested and not guaranteed. I wonder if there is a disclaimer in the front of his book this time? I suspect there is. This kind of thinking is quite different from books like the ARRL Handbook which contain only TESTED and PROVEN projects (with pictures and diagrams) for radio hobbyists.

The author notes that Cheek should have held off a few more months and written in some modifications for the Realistic PRO-2035 and PRO-60 scanners. In case you people are not aware, as of January 1st of 1995 all new scanners sold in the USA can not be easily modified to receive cellular telephone calls. This is entirely due to the American ECPA and is something that is very unique to the USA. Historically, Cheek has written of many radio related modifications (all grey in the eyes of the law) and now I don't think that he has too much more to say that's "exiting and new".

The reviewer notes that Cheek talks about different features that would go in to the "ultimate" scanner. He also mentions that four out of five of them are in previous Cheek publications. This goes hand in hand with my previous comments about the WSR in which Cheek makes MANY references to his books and previous WSRs to lure new readers into ordering WSR back-issues (which he will NEVER run out of) or his old, out-dated modification books.

Cheek talks about his idea of the "Ultimate Scanner": "...while he (Cheek) is intending to list features found in the PRO-2004/5/6/35, he may be more closely describing a BC-9000. Which offhand, does include CTCSS decoding and a channel selectable RF attenuator as included in HIS own requirements...." I don't know if Cheek is trying to suggest that Tandy follow Uniden's lead or if Cheek is totally unaware of the Uniden unit!

In the article, the reviewer talks about a blatant PLL synthesizer error made by Cheek in his book and how he made the same mistake in his WSR. This pertained to frequencies of the reference oscillator and the VCO frequency and how they work with the divider in a PLL system to maintain frequency. I don't

want to get into the technical side too deeply but I will say that the reviewer could possibly mislead people with his comparison of the VCO voltages of a 2004 and a CB radio. Only a scanner would call for such a high voltage for the VCO. This is entirely because it needs to cover a wider range and lock much faster than a CB. Nevertheless, the supply for the 2004's VCO is 30 volts and Cheek apparently had no idea what this voltage was for. If anyone here is genuinely interested I will explain how this collective PLL synthesizer works. Otherwise I'll drop it. Given my personal experiences with Cheek over technical issues, the above noted errors (or lack of understanding the basics) don't surprise me at all. The reviewer made a most amusing point about this when he said, "Would you trust a doctor that doesn't understand the basics of how your heart operates?". Bill Cheek is notorious for stating something profound and then when pressed is not able to come up with any proof of his claims. Quickly he digresses into personal attacks on anyone who points out his errors. Much of Cheek's advice is naive, short-sighted or simply rubbish. Most recently I've seen him give gain claims with no reference (or proof) and display an almost perfect ignorance of how complex antennas are designed and work. He's great at tap-dancing around the areas of knowledge he is lacking in. On other occasions I get the impression he feels he knows more than all of his readers so he simply guesses or makes it up as he goes along for the purpose of impressing them with his psuedo-knowledge. This was the case in the WSR when he was giving advice on purchasing a computer system and I think I made that quite clear in my review of the WSR so I won't get into it again. I guess this is what they mean when they say someone knows only enough to be dangerous!

The reviewer then talks of Cheek bedazzling readers with a spreadsheet programme that performs various radio related calculations. These involve dB and distance for longitude & latitude coordinates. The author felt that the descriptions of dB were good but were incomplete. This is totally believeable given Cheek's "TV Antennas Have Gain" nonsense on the FidoNet Scanradio group. Although I enjoy working with spreadsheets myself, I have two excellent shareware programmes that calculate all of the above with the addition of path-loss for VHF-UHF frequencies and perform considerably more involved technical transformations/ conversions all of which have proven useful. (if anyone want's copies let me know and I'll upload them here)

The reviewer writes, "......I hope in his next book he (Cheek) will discover (somewhat) newer Hack Worthy scanners and focus his attention on more mods and a bit less on attitude." Personally, I would not be at all surprised if this book IS Cheek's last one. I haven't read the "Ultimate Scanner" and have no intentions of purchasing it either. Cheek's attitude is nothing new to those who have followed his past rants/insults/

diatribes/lies on the Fidonet. He doesn't strike me as a chap
who is eager to win friends but is more interested in lining his
pockets at the least amount of cost and effort to himself.

Cheers!

Andy

In response to your question, yes it will scan faster if thefreq are in order. It has something to do with the way the cpu tunes the different sections in the radio. It is faster for the radio to keep tuning in one direction than to jump back in forth.

>

I tried an experiment with my Scout 40. I have a 70cms transmitter which runs 25W into a WX2 (vertical colinear) at a height of around 55 feet.

I left a friend running the transmitter (431.000 MHz) and went for a walk along the road with the scout - I used a Watson W801 aerial (wideband about 8 inches long).

I found the best results around 30-50 yards away where the scout was continually capturing continually - there were slightly fewer captures close to the house - only to be expected really since the aerial is supposed to radiate horizontally - not into the ground.

At the top of the road - around 100 yards, I was getting a capture every 20 seconds or so.

I think the results would have been better had my aerial not been so high...

This experiment was in the centre of Bristol, which is a large city with a high background of RF... for example, if I connect the scout to a discone at 35 feet it continually registers around 91 MHz - probably a mixture of FM radio stations - and when I go driving around I get a fair number of pager hits - however, I have known it to pick up a taxi base station from about 400 yards with intervening buildings - although I think that was exceptional in this area.

Paul

(PS. for those reading in the UK, I imported my scout from the USA, and saved money on the best price available in the UK - email me for details).

The above product that detects RF fingerprints is already in use in
NYC and LA and future cities are in the works(San Fran). So its a
matter of time before the legal cloners are driven out. But then again
there are more 'illegal' cloners than legal which is what the cellular
carriers are trying to combat.

Kansas City MO now has 3 riverboat casinos in operation.

I've found the freq for Sam's Town Slots 463.8875 mhz.
Fairly interesting to hear the jackpot payouts - would be interested in emailing anyone else with experience /interest in such monitoring.

Haven't located the Argosy or Harrah's freqs yet. I will give a tip for prospecting for an unknown freq - others might have better tips.
Get close by the site, the parking lot will do, remove the scanner antenna to eliminate weak signals. Use search mode in the most likely bands, I've been trying 461 to 464 mhz. Found Sams Town that way, haven't found the others yet. The "Beyond Police Call" book shows typical freqs for casino operations, under NV, NJ, MS sections. Our newer riverboats here in KC aren't listed yet.

Any other tips? Freqs to share?

Dick Williams Kansas City MO

Another option to shortwave is to use a satellite. A geostationary satellite can cover almost half of the earth in one broadcast. For example the US fleetcomsat is around 261 MHz can be heard almost everywhere on the earth thanks to several satellites.

An orbitting satellite in polar orbit will cover all of the earth in turn. There are weather satellites around 137 and 138 MHz and navigation satellites on 150 and 400MHz that can easily be heard on a scanner. These satellites transmitters could have less than a hundred watts.
If you wanted to send out a wideband signal like TV or WFM you would need from 10 000 to a million watts to compete with other broadcasters and cover a hemisphere on the world.

Good luck with your VHF transmission project. Please let us know the frequency you use, so that we can monitor it! :-)

>tone? Or does it not "receive" dial tones? For that matter, what's the
>most inexpensive way to get dial tones translated into actual numbers?

I assume that by "dial tone", you really mean DTMF or Touch Tone.
Only certain modems, typically those designed with voice mail
features, are able to decode DTMF tones. I had a ZyXEL U-1496E that
was able to do it.

One neat, cheap trick I've learned is to use a digital pager to decode
tones. You dial up your pager, and then play the tones through the
telephone handset. When your pager beeps, you have the decoded
numbers. Of course this can't be done in real time, so you'll have
to tape record your scanning session.

I am having problems getting the computer interface to work with my AOR 8000. I have tried every com port address combination and it does not run from the computer. I am using a nine pin cable adapter so that the interface (which is 25 pin) will work with my nine pin computer serial port. All of the addresses are correctly alligned but I am not getting any power. Any help would be much appreciated. TIA keith.

641. CT,NJ, Northeastern area freq. lists wanted

I've been expanding the scope of my WWW site (http://www.li.net/~j4dice/scanli.html) to include frequency lists and scanning info. (radio codes, unit ID's etc.) for the Northeastern states, and am seeking recent lists for Northeastern locations to add to the page. If you have a list you'd like me to add to the site, feel free to drop it to me via e-mail (j4dice@li.net) and I'll add it to the page. Corrections and/or additions to the lists already there are also welcomed.

GG>Hi, I want to being into Ham Radio but don't know what to do. Does anyone

What is Ham Radio, and
How do I get started?

A short introduction
by Hans Brakob, K0HB

Here on HamNet we frequently see messages asking for more information about the hobby, and how to get started. This file is a VERY brief attempt to explain the hobby and give some pointers on where to get more information. Almost certainly I won't answer all your questions, so feel free to ask for help on the forum. Hams are famous for their eagerness to help newcomers.

(First I have to explain something you might not have realized. In doing so, I'm going to paraphrase something written by Steve Ford, WB8IMY, in his introduction to a book entitled "The ARRL Operating Manual". Steve, by the way is a regular here on Hamnet. He acts as the ARRL HQ representative.)

In case you didn't know, belief in magic is a necessary requirement for all Amateur Radio operators. Of course, you won't see a question concerning magic or metaphysics on the test you take to obtain your license, but in your heart you will come to believe in that powerful, intangible force.

All of us in the hobby have felt its influence at one time or another. Some night when the band is dead as a doornail you'll be tuning aimlessly, not expecting to hear a single signal because NOTHING could be coming through at that hour. But then, rising out of the noise like a ghost, there will be a faint call from another stalwart explorer thousands of miles distant. You pounce, establish contact and both of you marvel at the fact that the conversation is taking place at all. A few minutes later, however, the signal vanishes as quickly as it came. Your rational mind will shrug it off as a quirk of propagation, but that little tingle in your gut will tell you otherwise.

If you could travel back in time to, say, 1294 AD, you'd probably be burned at the nearest stake for even suggesting that two human beings could communicate with each other over great distances without a physical connection. No doubt they would accuse you of dabbling in magic -- and

they'd be right!

As Amateur Radio operators, we work feats of magic every day. Many of us have become jaded about our powers and we tend to dismiss them as commonplace. We hardly think twice when we use our equipment to sommon the elemental forces of the universe. But every so often we need to pause and remind ourselves of what we are really doing. We need to remember the essence of what drew us to our unusual avocation in the first place: the wonderful magic of wireless communications.

So how can YOU become a magician?

First, you need to prepare to obtain a Magicians License. The Federal Communications Commission calls them Amateur Radio Operator Licenses, and they come in 5 "classes".

There are two "entry class" licenses, namely the Novice and Technician class. These two classes of license are designed to give the newcomer access to a number of frequency bands without a too-strenuous examination.

The Novice class gives the widest range of frequencies, and will be attractive to folks with a desire to talk to "distant" places. The written test is the simplest of all the tests, and the examination also requires you to be able to copy Morse code at 5 words per minute. This license will also give you access to some "local" bands, but not as many as the Technician class.

The Technician class license, as the name implies, is aimed more at folks with a technical bent (you don't have to be an electrical engineer though). The written test is a bit more difficult, but you don't need to know Morse code for this license. The frequency bands for this license give you more "local" communications, although if you wish, you CAN take the Morse test, in which case you will also get access to the "worldwide" bands the same as the Novice class.

The next three classes of license are General, Advanced, and Extra. These three classes have access to portions of all amateur bands, with progressively more difficult exams, and requirements for copying faster Morse code (13, 13, and 20 words per minute respectively).

To prepare for the exams you will need some study material and more information about classes, examination points (the exams are given by volunteer Hams in your community), and clubs in your area. A number of organizations will be more than willing to help. One such organization is the American Radio Relay League. Write them at:

I am looking for a decent (triple conversion if possible) scanner that covers PRIMARILY 108-136 Mhz and 220-420 Mhz (Aviation and Military). I am not that interested in a general purpose scanner.

From what I have seen, something like a Sony Air 8 might fill the bill, but I do not know much about this model. Either a desk model or a handheld would be considered.

Anyone have a beast like this they would want to sell or trade? Any information would be welcome.

Thanks,

Steve

anyone with acordless or cellulatr phone who thinks the conversations on these are private has rocks in their head or needs their head examined!!

these devices have antennas, radiate signals that ANYONE with a suitable receiver can pick up. I was walking through an apartment parking lot and had my scanner with me. A girl was standing in the parking lot talking to her boyfriend. I dedided to see how quickly I could find her frequency. It didn't take me long, I walked up to her with the scanner, she didn't believe it at first. I later explained to her that her `phone' was transmitting a radio signal and all my scanner was doing was receiving the signal she was transmitting. Cordless signals usually aren't that powerful. Cellular signals can be heard for a greater distance if you are monitoring the repeater or tower side!! I was at an airport waiting for a plane, I saw a man make a call on his cellular, I searched and found his frequency....nothing really interesting here, he was talking to his office about a pending business deal.

if you want privacy on a mobile phone (cordless or cellular, you are advised to get a scrambling device. There is a Place in Mesa Az on Southern called SPY Headquarters. They sell scanners along with phone scramblers and other related equipment....

I have had people call me from a mobile phone, I always can tell because there usually is more noise on the line than if they were using a traditional land line

if you want a list of cellular and cordless frequencies for your monitoring pleasure, just send me a SASE with a note indicating what you want JA Moran, P.O. Box 25506 Tempe, AZ 85285

Tricks for the Uniden-built/RS Pro-26 Scanner

by SysOp*Jeff Goldman WA1UDB

SFT Arrow (while radio's already on): to use arrows in Manual mode to change channels up or down

Hold the following buttons down while turning on scanner:

AUTO: enables/disables 100cps scan rate (enables/disables Auto Sorting)

DELAY: toggles between 2 and 4 sec delay

KL: turns Beep on or off

2,9: erases memories

2,9 SFT checks all elements of display WITHOUT erasing memories

2,9 KL displays firmware version (ie 6b4H USA 1.00) WITHOUT erasing memories

2,9 MAN or 2,9 MON or 2,9 CLR or 2,9 PGM loads one set of test freqs into channels 1-18.

2,9 MAN or 2,9 MON loads in 53-53.3MHz into the Limit Search

2,9 CLR loads in 511.5-511.9875 & 517.75MHz into the Limit Search

2,9 PGM loads in 173-173.3MHz into the Limit Search

2,9 AUTO or 2,9 L/O loads in a second set of test freqs into channels 1-14 and channels 21-30, while locking out channels 31-40. Both limits of the

Limit Search are 529.75MHz.

Take it easy,

Andy

I think the cops are just harrassing you. How many radar guns get
stolen?? You'd have to have some big gonads to go steal a radar unit out
of a cop car.

Joe, you might want to try making a simple 1/2 wave dipole cut to the
frequency you desire to listen to.

Robert I Sinclair (robert-s@ix.netcom.com) wrote:
: I am curious if anyone knows why FM broadcast station antennas resemble
: a fork like structure (usually there are four or more of these antennas
: stacked on the mast). What is there distribution pattern of this array?

The antenna bays look like an "X" that is folded around itself... like
one link of a DNA helix. The distribution is omnidirectional in the
horizontal plane, and dipole-like in the vertical plane. Their claim
to fame is that they produce circular polarization, so the
polarization of the receiving antenna is unimportant.

: What is inside the shaft like radome on TV Transmitter antennas. Why do
: some radomes have a series of "bow Ties" on the exterior.

Nothing. Many UHF stations transmit from "slot radiators"; basically
leaky waveguide. Bow Tie antennas are wide bandwidth radiators used
for VHF TV. They are directional, so every other one is typically
rotated a quarter turn.

: On a TV Transmitter tower how do they do maintenace, say on the lamps
: at the top of the antenna structure. Do they do this while the station
: is on air? TV 40 a local UHF station is purported to transmit at some 5
: megawatts. Wouldn't one roast like a chicken if you were within a few
: feet of the antenna?

I'd sure change that top bulb with the carrier off...

: Do all stations have SCA channel frequencies available?

All FM stations CAN have SCA; not all do.

Okay, here goes...this is an excellent 29-512 Mhz scanner
made by Uniden for Radio Shack, includes AC adapter, NiCad battery,
built in recharger, manual. Unit is perfect condition looks great.
Covers all the good stuff from 29Mhz to 512Mhz minus the usual gaps.
I'll sell it to the first taker with $45 plus $5 towards shipping.
This unit has 100 channels and is a super performer....this is a
real deal for a newcomer or to someone who wants a backup scanner
for the car/boar/etc.

I'm surprised to hear that the normal SS freqs were quiet. Try the NY State Police freqs as well as aviation freqs. I assume that he will fly into either Newark
LaGuardia or JFK and helicopter up to Hyde Park. Hudson River traffic is 123.05 and his heli will be callsign "MARINE ONE". Also try 123.1 as this is the New York City Police Aviation freq. Good Luck.

Yes.. the freqs were hopping! I was positioned overlooking Newark Airport at the Haynes Ave overpass of Rt 1/9 and saw AF 1 and Shepherd One land. During the course of his stay I monitored NY Citywide 3 police and 123.1, the aviation freq for the NYPD. They provided escort service for his motorcade as well as coverage during his helicopter flights throughout the NYC area. A good event to listen to...no doubt. Sounds like you enjoyed it as well.

BN> cellula r
BN> : capable(at least for now), but they are considered contraband by U.S.
BN> Customs ,
BN> : and could be confiscated if you try to bring them across the border.

```
BN> If they did, they would be exceeding their authority. According to the
BN> relevant statutes, it is illegal to import or manufacture for sale. The
BN> law says nothing about bringing one in for your private use, or even as
BN> gifts.

No, Bill, the rules don't say that.
47 CFR Ch. 1, section 15.121 says:
(a) Except as provided in paragraph (b) of this section, scanning
receivers, and frequency converters designed or marketed for use with
scanning receivers, must be incapable of operating (tuning), or
readily being altered by the user, to operate, within the frequency
bands allocated to the Domestic Public Cellular Radio
Telecommunications Service in part 22 of this chapter...

This says nothing about the intended use of the scanner, just that it can't
tune to the cell frequencies...
However, the Customs Service doesn't seem to be very keen on enforcing the
rules, as they seem to be allowing such scanners into the country on an
individual basis.
Hope this clears up any confusion.

Really? When I double 600 MHz, I get 1200 MHz. When I subtract, say, 880 Mhz
(right in the cell band), I get 320 MHz, not a negative number.

Right, Dick, those people are very security conscious.
In Vegas, I've been escorted out of a lot of casinos when I have a scanner.
A lot of the slot machines are computerized, and they are worried (rightly
so) that people will attempt to alter the machine's action with radio waves
(which could give one the idea that this *can* be done).
At COMDEX, I'm in the CIRCUS CIRCUS RV lot, and I can hear a lot of casino
freqs from there. The security freqs can get very interesting at times.

I'll answer my own inquiry about KC Riverboat freqs. In a prior message I metioned Sams Towns at 463.8875 mhz - that seems to pertain mostly to their slot machines operations.

Today I located a freq for Harrah's North Kansas City casino at 460.7125 mhz. Not as much action as the Sams Town freq - more routine security calls, escorts for money handlers, assistance with customers, etc.

I was asked off the property while prospecting for the freq. I had parked off the road near some new construction but guess I was noticed by security or management. They didn't question my scanner or reason for being there and I did get the freq I was interested in. I made sure I had the scanner turned down when they asked me to leave the construction area.

So add a new tip for propecting for freqs - blend in the with crowd, don't be obvious. My first stakeout and I was busted after about 10 minutes. The parking lot would have been fine, I was alone, away from other cars and thus attracted attention.

688. scanning train wreck

Newsgroup: rec.radio.scanner
Date: 1995-10-16 00:00:00 UTC
From: jamoran@indirect.com
Message-ID: <45sfha$blr@globe.indirect.com>
Source record: 247718

i happened to be on I-10 on my way to Valencia. i was going to Magic Mountain. As I passed the Buckeye area, Mile Marker 120, I started to hear lots of chatter about that train wreck near Gila Bend. The Maricopa County Sheriff's frequencies (460.05 ch-1 WEST) and also the Arizona Highway Patrol/ Department of Public Safety (DPS) 460.300, and 460.325 suddenly became quite active. I thought that was odd since it was about 1am.

I was able to monitor the activity on these frequencies until I was half way between Blythe and Indio California.

At the time I was on the road, i had no Idea that a train had wrecked and that foul play was involved.

The traffic I heard involved trying to determine exactly where the train was and which agency would b e responsible, The DPS, Maricopa County Sheriff, or Yuma County Sheriff. I did not have my other scanner with me. the AOR-1000. I had sent it in for repairs. the AOR-1000 has several train frequencies programmed in it. I did not have any train frequencies in the radio, (REgency HX-2000) I had with me.

JOHN/PHX (jamoran@analon.com) computing & making good Chemistry!

sure hope they catch those responsible for causing the train wreck... Historically, whenever the FBI gets involved, they have a good track record of eventually solving the case!

Without starting a flame fest or eternal thread I wonder waht peoples thoughts on radio privacy are.

If you intercept a broadcasted radio signal on your own property and listen in on it (but were not the intended recipient) is that wrong to do?

Who should assume the responsibility of radio security? The originator of the transmission or legal restrictions to possible eavesdroppers?

What would constitute malicious interception of a transmission?

Who is the rightful owner of a braodcasted private communication?

Should it be considered acceptable (legally, socially, morally)for purported private communications to be intercepted by parties that are not the intended recipient?

should or would you be concerned about others listening to your "private" communications?

If in commerce a competitor listened to two way radio transmissions of your company and used the information garnered in this manner against you. Would that be OK? Is that use of radio recievers considered legal?

Should the government be involved in the selection and administartion of encryption tools for private communications? Can the keys really be kept secured in that scenario? What if the key codes got out of secured storage?

If a pay television microwave broadcast is intercepted and decoded to provide free viewing of the content would you consider this to be fair? What if you were the service provider?

MHO:

Soon I anticipate major radio systems (I.E. municipal, public telephone, SMR services etc) to be converted to digital in the not so distant future. This will certainly make eavesdropping more difficult. Personally, I think that if you are using a radio system you are responsible for ensuring security. However, I think it should be considered unlawful ford a third party intercept an encrypted transmission with the intent to decrypt and monitor the content without knowledge of the originating party.

Robert-s

691. Introduction to Scanning

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 and PRO-60 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu (until Oct. 10, 1995)
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob

Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in

1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various

communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC, Aurora Ave.
August 19
October 14
December 9 - Philly's Restaurant, Rt 83 & 63rd St., Willowbrook|

Bring a notebook.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military

installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like

"Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s]

missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 110 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these recent scanner models in Monitoring Times magazine:

Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable |

Note: Reprints of Monitoring Times articles are available for $2.00 each from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on

conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three

instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be

associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250

channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests,

often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord.

Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage. Cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio.

Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning.

PRO-26: Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. Audio suffers from small speaker.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob

Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from Federal Signal in University Park, IL, and may be available in the future from:

Woodson Electronics/Plectron

A girl was standing in the parking lot talking to
>her boyfriend. I dedided to see how quickly I could find her frequency.

>It didn't take me long, I walked up to her with the scanner, she didn't

>believe it at first.

No, no...DON'T tell them that you can listen! That way, they will
continue to be totally ignorant of way their cordless phone works and you
can continue to monitor their conversations! <g>

Andy Moss (tubegod@cml.com) wrote:

: : : The modification can also be found, for free, on "ftp.oak.oakland.edu".

: : Well, which came first - the ftp mod or Cheek's mod? Are they identical or
: : different? If different, which one is better - and why?

: Hi Bill.

: Be sure to read my thoughts on Bill Cheek and the USSN's thoughts on his
: newest book.

I know how you feel about Cheek. His personality is not one of my favorite types either. I think the USSN review was a crock of bull. So what if he only covers scanners that can be modified? That is the purpose of his books. He does tell how to apply some of the mods to other scanners.

: Better yet, take a look at my thoughts on Cheek's "World Scanner Report"
: as posted here a couple of months ago. If you are in need of another
: copy, let me know and I'll pass it along.

I have seen it. I think a lot of your points are just being picky. However, I agree that Cheek has too much bitching in his newsletter. It is not as good as it used to be. Whether it is worth the subscription price is for each individual to decide for themselves.

Bill

From: dean@defcen.GOV.AU
Message-ID: <45t3pd$nlb@helotrix.defcen.GOV.AU>
Source record: 247728

I'd like to make a HF aerial to improve the reception
of my AOR-1000 at the lowest possible cost. I guess
a line of wire out the window would work, but I'd like
some help. What length of wire should I use (half-wave?)
and what is the best way to mount it onto my scanner, which
has a BNC connector. Please post to the list; cheap pro
jects
like this might be of interest to others.

Thanks

The ICOM is not that bad... It may not be worth $400 used but it is
still a pretty good scanner. I have used this in metropolitan NY near
large comm. sites and have not had much difficulty. In fact,
I use this thing primarily in the 900MHz range and I detect very little
intermod (I guess you mean adjacent channel desens) but, like any
broad band receiver, I accept that as part of the package. These
are triple conversion though which does help. Perhaps the difference
is that mine is virtually brand new and maybe they have made
changes to help out the front end.

In article <jwaydaDG21y0.2Ms@netcom.com>, jwayda@netcom.com (Jim Wayda) says:

No they can't really - the licence plate only tells them (via radio & the
Police computer) who the car is registered to and the make, model and colour.

In the UK you don't have to carry your documents i.e driving licence &
insurance certificate. You get 7 days to produce them at a Police station.
Failure to produce is an offence, as is having no licence or insurance.

> In my country (The netherlands) you can offen hear policemen check if there's

You should get your insurance company to sue the driver although the
chances of getting any money/compensation are low.
(He MAY be in prison - depends on the Judge etc)

JA> would give me more range than the whip. Thanks for any help. Joe

There ate two ways to increase the range of any scanner. Both involve the
antenna. They are:
Directionality. A directional antenna will exhibit gain in it's forward
direction, at the cost of lower gain in other directions.
Altitude. Since most signals standard scanners receive are line-of-sight,
altitude extends the line-of-sight range.
Another way to do this is to design the antenna so that it is peaked to
operate on exactly the frequency you wane, but that doesn't work as well as
the others.

The information that hackers intercept for their cloning is sent over
the control channel frequencies which are digital (frequency-shift
keying). The fact that the information (Electronic Serial Number,
etc.) is PLAIN TEXT is the reason why there is so much fraud.

Cloning cellular phones in itself is not illegal - using more thtan one at a time, however, is illegal. I have been working at Bell Labs for quite some time on several projects that look at cellular clones, velocity checking, tumbling fraud, etc. Some of the systems look for more than one cellular phone operating at the same time or operating at unreasonable distance/time situations (cannot operate a cellular phone in California at 1:00 PM EST and then in New York at 2:00 PM EST). These systems usually do not disconnect cellular phone calls, but will report the Mobile Iden. Numbers (MINs) to the respective cellular companies.

Aha....the UBC varient, not the BC varient as found in the USA.
Bearcats outside the US are prefixed UBC, in the past this usually meant
66-88MHz on low VHF rather than 29-54 found on US versions.

The UBC2500 never made it to Europe as far as I am aware, I only saw the
BC2500 and the UBC3000 & UBC9000 are still awaited. It would seem they
do "exist" as a post sometime ago (also from Australia) indicated somebody
had obtained the UBC9000XLT, again I would assume this was full coverage
rather than 800MHz "blocked". New European regulations mean that radios
have to be CE approved in a similar fassion to FCC approval for sale in
the future - this seems to be the delay on the new Bearcats being
available here in Europe....anyway I digress....

> Ah...you must have the newer version of the 2500. Hence, you won't be
> able to modify the unit for continuous 800 Mhz coverage. Some older models

I should think as its the UBC2500XLT it may well have full coverage out
of the box. Perhaps you could just confirm this Ian if possible.

Hi there,
last year we were involved in a car-accident in Scotland. As the police arrived at the scene of the accident I asked several officers, if the man who caused the accident was insured. At that moment nobody could/would tell me if that person was insured. Now I was wondering, if the UK-Police has't got the possibility to check licenceplate and insurance of a car over the radio. In my country (The netherlands) you can offen hear policemen check if there's an insurance available for the car, if the person who's driving has a drivers' licence and if the APK (which is a check a car needs every year) is O.K.
Well, after a few weeks, they told us that the driver that caused the accident had no drivers' licence and no insurance. So it could be that this was the reason

The original price for the PRO-43 was US$350. $260 is probably a reasonable
asking price.

From: geis@ix.netcom.com
Message-ID: <4614p9$kek@ixnews4.ix.netcom.com>
Source record: 247673

I have posted a request for some info on a pro 37, but no response. Is this such an outdated model that there are none out there? I bought the scanner some time ago and I believe I had it modified. I would really appreciate it if someone would answer the following questions. Excuse my lack of knowledge.

1. How do I tell if my scanner has been modified?
2. Is this still a fair scanner for occasional use?
3. The "limit", arrow up and arrow down keys work, but need to be really pushed hard to make respond. Is there anything I can do about this?

Thanks very much. geis@ix.netcom.com

723. Which to buy: AR8000 or MVT 7200?

Newsgroup: rec.radio.scanner
Date: 1995-10-17 00:00:00 UTC
From: wally@msn.com
Message-ID: <46183l$fuc@calliope.wln.com>
Source record: 247674

I currently have an MVT7100 - good rig, would like computer control of the 8000, but not interested in losing quality of radio. Any really strong opinions out there? Seems to me the two radios are pretty close to each other in performance, with slight preference of the ultimate quality of the 7200. Haven't been able to determined, however, *where* the 7200 excels, so I can't decide whether its strong features outweigh the lack of computer control.

HELP!
thanks!

Well like i said lots of the new phones like my micro-tac lite do
have a sticker above the ESN sticker that say "832/2412 channel
operation" and that is a wide open band as far as i can tell if
the 832 channels end at 894 and 894-999 is used up you'd think
thats where the 2412 channel phones would show up.... and if it
was an image i get "NO" images on my 2035... Due to the triple
conversion which is refereced in the catalog not in my manual...
-=White Heat=-

P.S. i should put my phone in test mode put it on channel 2412 AND
FIND OUT

: Got a puzzler for you E.E. experts out there. Scanner works ok with
: battery and adapter but won`t work with battery alone, *unless* you
: start the scanner with the adapter and then disconnect the power cord.
: Then scanner will then work with battery alone, until you turn it off and
: on again, then it won`t restart on battery alone *unless* you leave the
: unit running with the battery pack for some time, after which you can
: turn unit on and off at will. Unit will then work for several hours on
: battery alone.

: Examined insides of battery pack; contacts; can find no obvious damage
: or loose connections. Battery pack is six cell nicads (Sanyo), apparently
: in series; rated at 7.2v 600 mAH. Don`t know exact condition of batteries;
: but they appear to be putting out above 8.5 volts on a VOM (VOM may be
: inaccurate).

Hey, I'm not really an expert, but I used to have a BC100XLT with the
same problem. I finally traced it down to a bad wire running from the
nicads to the circuit board inside the battery case. My problem was easier
to diagnose because the wire was flattened at one point, and most of the
strands inside were broken. I assumed that with the adapter plugged in,
it sort of "jump started" the battery, allowing it to continue working,
yet, it couldn't start on it's own. It was obvious that some sort of malady
befell this wire at the factory, seeing as how I was the first person to
take the cover off.

Maybe you have some similar problem. I replaced the wire, and never had
any more problems. I now have a BC200XLT that works great.

Good luck...

> hold it in her lap. :-)

I would like to add to you list of things to do on this scanner. Cut the AC cord so that it is about 4 centimeters long. Attach a male plug to it. attach a female plug to the old wire. This keeps you from tripping over that damn wire every time you get out and walk around with the thing. Rat shack should have made this thing so you can plug an ac cord into it. How about that marketing concept? give it a try, eh.

As for the bracket, go 3rd party.

Later...
Pete

The 2412 channels refers to the propritary motorola N-AMPS system that can accomodate three users per analogue channel. Not to be confused with D-AMPS which is the TDMA digital system. N-AMPS is analogue with a 10KHZ channel size. I don't know of any place in the US that is using N-amps. If someone knows about it let us know. RS

>Is there any scanner available that can be used as a limited
>spectrum analyser ? Perhaps connecting it to a ossilloscope or PC
>for display ?

I've been looking for such a setup. I considered and disqualified the Standard CCR708A test receiver since the spectral display doesn't have the resolution nor the bandwidth I wanted. Also, when I called twice to ask for information, and was told that it would be mailed immediately, it showed up three weeks later. The US Postal Service isn't THAT bad. I can just imagine what would happen if the receiver ever needed repair.

My current plan is to add an AOR SDU5000 to my ICOM R7100. The SDU5000 is advertised to give a 10 MHz spectral view. It includes a color LCD on the front for a display and runs off 12 VDC (mandatory for field use). The SDU' also has some nice features for "search and locate" purposes, like peak hold, marker, etc. A description is available on the Javiation Web page at http://www.demon.co.uk/javiation/

But beware, this isn't a cheap solution. The SDU5000 costs as much as my R7100!

Conor,
Use a volt meter and make sure the lighter adaptor
you bought is configured properly for the scanner
you want to use it on.. (+) voltage on the proper post..
I bought a 12 Y adaptor from RAT shack
One side of the Y was correct
the other leg og the Y was wired up BACKWARDS
This blew up a 300.00 piece of equipment.

I never went back to them to jum up and down several times...
The equipment was not fused.. I'm not saying that this would had helped

Good luck

: I need to know if anyone has decoded the Motorola MDT.

: Does anyone have a kit or what?

Howdy,

From what I understand the data is sent "in the clear". However, the format of each screen is such that making sense of the information is damn well difficult. Not to mention the copious amounts of data that is being sent. My friend was easily able to decode the characters but assembling it into something cohesive was a lost cause.

Motorola would like you to believe that you will go to jail for decoding it - or "hacking" any of their "secrets". I say they are full of sh*t. Many companies are shying away from Motorola two-way due to their business ethics and they intentional incompatability with other systems.

Cheers!

Hello everbody,
I just moved to the San Diego area and was wondering
what are the active police,fire,etc.... freqs. I would also
like to know if the police or fire are useing the freqs. above
830Mhz to 860Mhz range. Any informaiton will be greatly
appreicated!!!!

e-mail to herring1@ix.netcom.com

THANKS IN ADVANCE
Brad

The only cellular mod for the 26 is to return it to Radio Shack and
purchase a cell capable 26 from Javiaton in the UK. They will ship it to
you and you will pay about the same amount that you paid for your blocked
pro-26 from Radio Shack.

Source record: 247608

My BC100XLT appears to be dead. The symptoms are: Powers up, won't scan, no audio, all channels locked out, won't receive, no display problems. Is this common and where can I get it fixed?

Thanks,

Tom.

>Well like i said lots of the new phones like my micro-tac lite do
>have a sticker above the ESN sticker that say "832/2412 channel
>operation"...

Perhaps the 2412 is a marketing ploy which indicates the phone
is a dual mode AMPS/TDMA phone. Using TDMA (time division multiple
access), multiple conversations are multiplexed on the same RF
frequency, so the marketers may be counting each RF channel
as 3 virtual channels.

>... i get "NO" images on my 2035... Due to the triple
>conversion which is refereced in the catalog not in my manual...

Triple conversion scanners are less prone to (but immune from)
receiving images.

For Europe, Channel X-Ray Fleetsatcom West 261.675MHz
(extensive phone patch use).

Sorry, I can't confirm an exact freq for the other three Fleetsatcoms.

However...

Mil sats vary between 225-400MHz.

LeaSat USN 243.850 - 243.900
Fleetsatcom USN 243.960 - 244.100
Marisat 248.800 - 249.400
LeaSat USAF 249.350 - 249.850
Fleetsatcom USN 260.775 - 268.350

FM deviation = 25kHz. Try WFM for best results.

Let us know when you get results!

Best,

Clive.

From: bill.funk@iotp.com
Message-ID: <8B35015.0792003D50.uuout@iotp.com>
Source record: 247535

On 16 Oct 95 05:53am, ROBERT I SINCLAIR wrote to ALL:

RI> Without starting a flame fest or eternal thread I wonder waht peoples
RI> thoughts on radio privacy are.

All are my opinion, only...

RI> If you intercept a broadcasted radio signal on your own property and
RI> listen in on it (but were not the intended recipient) is that wrong to
RI> do?

Why not? It's been broadcast onto my property.

RI> Who should assume the responsibility of radio security? The originator
RI> of the transmission or legal restrictions to possible eavesdroppers?

It would seem to me that the one who wants the privacy should provide it. legal restrictions of this sort only make for bad laws, as they cannot be enforced.

RI> What would constitute malicious interception of a transmission?

Malicious? It would seem obvious that malicious interception would be interception with the intent of doing harm of some sort to the one doing the transmitting.

RI> Who is the rightful owner of a braodcasted private communication?

Problem: there is, IMO, no such thing as "broadcasted private communication". Broadcasting the info removes privacy. On top of that, how can anyone own any radio waves that have been broadcast? They go where they go, and cannot be recalled or controlled by the broadcaster, which means the broadcaster maintains no control over them.

RI> Should it be considered acceptable (legally, socially, morally)for
RI> purported private communications to be intercepted by parties that are
RI> not the intended recipient?

Legally? Yes. Socially? What's that? Your society or mine, or his? Morally? Who's morals? Yours, mine, or his?

RI> should or would you be concerned about others listening to your
RI> "private" communications?

Yes, I'm concerned. Concerned enough to ensure that anything I broadcast won't come back to haunt me.

RI> If in commerce a competitor listened to two way radio transmissions of
RI> your company and used the information garnered in this manner against

RI> you. Would that be OK? Is that use of radio recievers considered legal?

That comes under the heading of 'malicious reception'. It also comes under the heading of 'not very smart' on the part of the transmittor.

RI> Should the government be involved in the selection and administartion
RI> of encryption tools for private communications? Can the keys really be
RI> kept secured in that scenario? What if the key codes got out of secured
RI> storage?

Definitely not. Governments are not supposed to be for the control of it's citizens, but rather to help the citizens do what they can't do for themselves. (Boy, I'll hear about *that*!)

RI> If a pay television microwave broadcast is intercepted and decoded to
RI> provide free viewing of the content would you consider this to be fair?
RI> What if you were the service provider?

Fair? Who ever promised "fair"?

Well...I don't know how to break this to you Andrew...But I built an
Interface by following the details in Bill's latest book....The cost was
modest...about $50 Bucks....I also included a DTMF an CTCSS decoder for
another $20 Bucks.....I don't know....Bills design works very well and
guess what? There are probably quite a few folks that might learn
something about their scanners by building Bill's kit....

Perhaps you should try a different color...Green does not suit you very
well...And learn to to take a joke.....Otay?

> However, when I turn it on it scrolls a message across the LCD that
> says 'AR2015'.
> Which model is it?

It was an AR2002 that is now an AR2515, not 2015 :-)

ACE Communications modified AOR AR2002's by replacing the main processor board. It was not an AOR Japan product. The end result was 1984 memory channels together with 12 search banks and a scanner that, at the time was considerably faster than anything else. The AR2002's actual receiving circuitry stayed (except a few minor twiddles). The AR2002 as a radio was (and is) very good indeed however as the unit only had 20 memory channels and two speeds of slow and slower it was falling behind in the popularity stakes. The AR2515 was something new.

The 1984 channels are organised into 62 banks 32 channels. You cannot program frequencies into specific "channels" within each bank as the the main CPU organised each bank into numerical order. It didn't matter which order you keyed frequencies in they would be sorted numerically. The reason for this highlighted one of the AR2515 problems in so much as the replacement CPU ran faster through the channels that the original AR2002's PLL circuitry could keep up with. By numerically going up through the bank it helped the PLL in locking up a little quicker and allowing the '2515 to stop when it "heard" a transmission.

When you do program the unit up it would also be a good idea to perhaps organise you banks in progressevily increasing frequency areas.

You could scan a single bank or link any number of banks together.

Banks 63 to 78 were search banks where you could add a lower and upper limit together with mode and increment step to search between - again the unit was very fast cmapred to others but at times ran a little too fast for its own good. Having the "DELAY" on was usually a neccessaty.

> I also am in need of an owners manual for it (xerox copies gladly accepted)
> and would like very much to get ahold of the software and cable to
> allow computer control. Are there any shareware programs, or is the only
> source through AOR?

Try ACE Communications for a copy of the manual, if not I think we may
have a copy left over but I'd have to hunt around. There was an AR2515
specific package around a few years back produced by Gesmundo (?), I'm
not 100% sure if some of the newer control packages such as ScanCat Gold
or Scanstar would drive the '2515

I have several of the Pro-2026 and love 'em. I have a R-700 here in the shack but still use the '2026 to scan with. They're 100 channel and 12V (get a $5 adapter for 110V use). Rat Shack puts them on sale for around $149. They list at $229. I doubt you can find the older models that can be modified for cellular. If you do, jump on one. There were 2 used ones posted here recently for $150 which is a good buy. I have one that's still can still be mod'ed, new in the box, but wouldn't let it go for less than $225. (They're hard to find)

i've also built this converter- and it didn't work.
just static i think maybe the mar-1 is bad but dunno for sure.
i called ramsey tech and they said input vdc to mar-1 should be 1vdc
and output 5volts dc
i dont know what ill do either
ramsey will fix it for 18.00 for 1/2 hr min--- shit man!
that 50.00 should have gone for a used cell en scanner

Your Radio Shack should be able to order the mobile bracket through
their CMC Catalog.

When I put my Pro-2006 in my truck, I bungee cord it to my CB. Works
great and its cheaper then the $24 bracket.

:my fax/voice/modem's intelligence, and make it decode DTMF for me?

Ok, fill me in. Is there some kind of conspiricy to drive me nuts going
on? This must be the fifteenth post asking this question in the last two
days. The answer is *NO*, modems do not decode DTMF, they merely *encode*
it. The fax tones are not DTMF. There is software available that can do
this for you via your sound card, but not through your modem.

I've got the Pro-39 as well. They do pick up cellular phones so that's probably why.. they're
clearing them out to make room for the new ones that don't pick up cellular.

>between portable telephones and the base stations are not broadcast.

I don't think I'm the one who misunderstands the word
"broadcast".

According to The American Heritage Dictionary, the word
"broadcast" means:

"1. To transmit by radio or television.
2. To make known over a wide area.
3. To sow over a wide area; scatter."

This is what happens with ANY radio signal, not just
commercial TV and "broadcast" radio stations. When you use
a two-way radio, you are "broadcasting" in the strictest
sense of the term.

Therefore, I stand by my contention that an unencrypted
radio signal cannot be "private" because it has been
"broadcast" by radio.

This is Robert-s, the original poster of the question reagrding radio
privacy issues. When I used the term "Broadcast" I was referring to the
transmission of a signal in a non confined, non directional pattern. A
requirement of mobile radio where the user may be in differnt areas.
Not to reflect wide dispersion of information for a large group of
people (conceptually broadcast is to reach a large number of people).
This differs from transmissions confined to a communication system
(such as Cable television) where the signals are restricted to the
property of the transmitting party (cable). I do agree however that if

a signal is going to be transmitted in an unconfined manner then the transmitting party needs to assume that the link is not secure and conduct him/herself accordingly.

Hello! I would like that someone provide me with *ALL* of the trunked frequencies for:

1)Alameda County (Ca) Sheriff's Dept
2)Alameda County Fire Dept
3)Hayward Police Dept
4)Oakland Police Dept.

I live in the East Bay region of the San Francisco Bay Area. Recently all of these agencies switched to trunked frequencies. I have a few of the ones used by Alameda County Sheriffs and Fire and the main dispatch for Hayward Police and Fire. I don't have anything for Oakland Police. I don't care how many frequencies that this request requires. I have a 200 channel scanner (Realistic Pro-34 hand held).

Thanks in advance!!

Chris Halladay (CHalla1610@aol.com)
Castro Valley,Ca

P.S.:I would prefer that this request be answered via email. Thanks again!!

789. Re: info:wanted police car computer!

Message-ID: <467lk7$2l5@newsbf02.news.aol.com>
Source record: 247546

Okay, let's figure out what you're referring to, first.

Some police departments actually have computers in their cars--laptops mostly. They operate just like any other computer does, allowing them to do word processing, etc.

Some police departments have mobile data terminals in their cars. These are connected by radio to the comm center and allow the exchange of data between the dispatchers and the patrol officers. In some departments, MDTs are also connected to other law enforcement computer systems, such as DMV, warrants, etc.

Now, there are MDTs that are only that--MDTs--and there are laptops that are configured to be MDTs. So if you see a computer-like device in the patrol car, it could be a stand-alone laptop, a laptop connected to the radio, or an MDT connected to the radio.

Hope this narrows it down.

Newbie Needs Yagi Help

I recently attempted the construction of a 3 element Yagi antenna in the 6 meter band. I constructed the antenna with the intent of receiving only. The result of my endeavor is only slightly better than the Radio Shack all band ground plane antenna. The following questions arise:

1. Given that the elements are spaced properly, how important is it that the elements are parallel?

2. The ARRL Antenna Book indicates that an element with an aluminum mounting plate should be longer then an element without a mounting plate, however the Yagis Analysis program returns an element that is shorter with a 4" x 4" aluminum mounting plate. What am I missing here.

3. The antenna book doesn't discuss the lengths of the driven element mounted on a non conducting plate vs. the parasitic elements mounted on aluminum plates. I assume the driven element is calculated using the Yagis Analysis program as if it had a 0" x 0" plate while the parasitic elements are calculated with 4" x 4" plates and the results are combined.

4. If 75 ohm coax is used for the balum rather then 50 ohm will this dramatically degrade performance? If 75 ohm cable is used for the feed line will this degrade performance?

5. What does the hairpin match do?

6. How does one successfully solder a copper strap to the back of the SO-239 feed?

Any comments would be appreciated.

Thank you in advance.

>use repeaters. CHP Base antennas are typically located thousands of feet
>above sea level on mountain tops, and therefore can receive the low power

I thought the CHP had dropped their old system and had gone to a new
repeater system?

The Ontario Provincial Police did that about five years ago, moving from
their old 42 MHz equipment to the "new" 142 MHz system. At the time I
could receive OPP base stations up to about seventy miles away but I
could only hear the mobiles that were within ten or fifteen miles.

Apparently they switched over primarily because the system was almost
fifty years old. Of course it also doesn't hurt that occasional skip
conditions brought in regular interference from the Missouri State Police.

796. Pro 43 Technical Questions

Newsgroup: rec.radio.scanner
Date: 1995-10-20 00:00:00 UTC
From: dbowlby@chat.carleton.ca
Message-ID: <DGr5z8.5F2@cunews.carleton.ca>
Source record: 247553

I have a few tecnical questions pertaining to the Pro 43 I hope
someone can answer.
I found that if you have a frequency programmed into the scanner and then
you lock it out via the diode, you can still do a frequency search
using the "direction" search in that frequency range. I was wondering
if you could program in cellular in the EEPROM then remove it and
place it into a scanner with permanent cell block to regain cellular.
Would the memory survive? And if so what must be done to protect the
chip from static?
Also can this scanner be modified for comercial bands?
Was this CPU designed to be used in something else such as a different
scanner?
The following pins on the CPU are listed as NC in the service manual
yet are allocated to a port or function in the IC block diagram for
the CPU or are connected.What could their true function be?
Pin 56 or 57 is part of the system clock generator sub system ("XT2").
Pin 29 is allocated to port 4, part of the band output switching.
Pins14,15 and 16 are allocated to memory and LCD control. Could this
possibly be a way to expand the scanners memory even more?

Thanks in advance

: I don't understand your problem. I have had my R7000 for almost 3 years
: and never have had to replace a battery. still works fine. It is in
: constant use here every day. I never turn it off.

DUH... forgive me for pointing out the obvious but...
that IS the problem. His keeps failing !!! Ours don't...

Sounds like something is creating an excessive current drain on the
battery. Either *that* or you have extraordinary bad luck in selecting
battaries. Have you measured the current flow with the radio OFF and ON
to see how much current the system draws???

My R7000 is probably five years old and the battery has never been replaced either...haven't looked at the schematic to see what could cause it but are you using high quality, name brand battery?

I suspect he is unplugging the radio for long periods of time and you aren't. The battery keeps the memories in place when not
plugged in. Too bad they didn't use a NiCAd affair, with a charging circuit to keep the memories up instead of a costly P-I-T-A to
replace lithium battery.

So broadcast means to cast seeds. What has that got to do with this discussion?

I am not the one who does not understand the meaning of the word "broadcast" when used in a legal sense in reference to radio transmissions, you are.

If you are going to use a technical word, then you need to use the technical definition. And the FCC defines it to be an intentionally one-way transmission. So when talking about what transmissions may be intercepted, recorded, repeated to others, etc, this is the ONLY definition.

The reason this is an important point is not so some ego can bloat. We have enough of this already. It is important because there are FCC publications which say things about broadcast transmissions, and broadcasts, which might lead someone to think that it is legal to listen to many kinds of radio transmissions which it is illegal to intercept, based on an uninformed belief that all transmissions are broadcasts.

Ham radio operators are PROHIBITED from broadcasting. Some ham please confirm this so I won't have to listen to more ill-informed persons complaining about this.

Oh, and Mr. Stark, please get a copy of CFR 47 and read it. Your library probably has a copy.

Yes. Being of dual-conversion design, the images of cellular frequencies
appear within the tuning range of the receiver.

Sorry GMRS is so inactive in your area.

In Southern California, the Repeater Users Group governs about 20
repeaters that we use daily for emergency traffic information, Events,
and American Red Cross work. Users of the system operate under RUG's
License, and over 250 Members of RUG have their own GMRS Licenses.

Hi Folks...

I just purchased my first reciever (and AR-8000), and I'd like to get to get either a single, or pair of antennas for home / mobile listening. I live in an appartment building, and have a sporty car, so appearance is important. I've been told that Rad-Shacks ground plane antenna (~$50) works real well for a base antenna, but I haven't seen the size of the thing yet. Any suggestions, or experiences on the topic would be greatly appreciated.

Thanks..... Joe Farhat

> Is there a modification that can be done on this handheld to increase battery
> life? The batteries only seem to last one to two hours when fully charged.

I've heard of modifications to correct a problem with the radio
erroneously detecting low voltage, but I'm not sure if they're really
proper. There has been a lot of debate about the 100/200XLT battery
problems. My 100XLT's battery is several years old, and now last about 90
minutes on a 16 hour charge. Needless to say, I don't use it much!

There is another solution, however. There is an aftermarket supplier
(Metro West) who makes a high-capacity replacement battery pack and
charger. Grove (800-438-8155) has it in their catalog - item BAT-9,
$74.95. It is a 1200 mAH pack, which is twice the capacity of the original
pack.

No endorsement implied. I haven't done business with Grove, and haven't
tried this battery. In fact, I'd like to know of anyone else's experience
with these packs. Are they worth it?

The FCC definition is not "technical", it is "legal".
There is a big difference between the legal definition of a
term and what it actually means. That is the whole problem
with ECPA and its related legislation.

The word "broadcast" still means what it has always
meant, despite the attempts of Congress and the FCC to
define the laws of physics and nature.

>intercept, based on an uninformed belief that all transmissions are
>broadcasts.

It is the legislators who are uninformed, not those of
us who actually USE the technology and understand what is
really happening.

>Ham radio operators are PROHIBITED from broadcasting. Some ham please
>confirm this so I won't have to listen to more ill-informed persons
>complaining about this.

I am an Extra class ham operator and have been licensed
for 14 years, thank you very much. I understand that we
cannot violate the LEGAL definition of broadcasting
(actually, I believe the phrasing in Part 97 refers to
"one-way transmissions" - the word "broadcasting" appears
in ARRL summaries of the rules).

>Oh, and Mr. Stark, please get a copy of CFR 47 and read it. Your library
>probably has a copy.

Already have. I also have a copy of Title 18 and other
miscellaneous regulatory junk.

The law says, in effect, that if you don't INTEND to
"broadcast" your unencrypted analog radio traffic, then it
is legally "private".

The real world demonstrates that, regardless of the
sender's INTENT, any unencrypted analog radio transmission
has been "broadcast" (in the dictionary sense) and cannot
be "private", any more than yelling your message across the
street is private.

No more legislative hair-splitting, please. "We've had
enough of this already."

73 de Dave, NF2G

Hello,

My church youth group is going to be providing a sort of communications command center during an upcoming city festival which draws 100,000 people over two weekends in December. We are soliciting donations of radio equipment of all types: CBs, scanners, Ham radios, etc. We have people who are licensed to use Ham radios. But what we really need are handheld CBs and scanners. Shipping will be paid by us and you can rest assured that your donation will go to a worthy cause that will get all the use out of it that's possible.

Please email me.

Thank you,
Chip Adams

: >stations, and Commercial Radio stations broadcast. The transmissions
: >between portable telephones and the base stations are not broadcast.

: I don't think I'm the one who misunderstands the word
: "broadcast".

: According to The American Heritage Dictionary, the word
: "broadcast" means:

: "1. To transmit by radio or television.
: 2. To make known over a wide area.
: 3. To sow over a wide area; scatter."

: This is what happens with ANY radio signal, not just
: commercial TV and "broadcast" radio stations. When you use
: a two-way radio, you are "broadcasting" in the strictest
: sense of the term.

The last time I checked, "broadcasting" was not an exchange in
transmissions at all - it refers to a one-way transmission. "Broadcast" is
usually replaced with the word "transmit" when talking about two-way
communications. If you are talking about many "transmissions" they are
in fact not readable over a "wide area" like you so imply. Even
continuous transmissions by microwave link could hardly be referred to as
"broadcasts".

Case in point. In my country it is illegal to "broadcast" on amateur
radio. Clearly, this doesn't mean that you can't "transmit".

: Therefore, I stand by my contention that an unencrypted
: radio signal cannot be "private" because it has been
: "broadcast" by radio.

Nonsense.

Cheers!

Andy

I live in Sonoma County, CA and have been listening to the CHP for
years.

For the last month or so I've been hearing "Golden Gate" (42.880 Sonoma
County Orange) on 453.825, loud and clear all over the county and now
it's gone.

At one point I heard a mobile unit trying to talk simplex with Golden
Gate and the mobile referred to "high band" like this, "golden
gate.......ten victor eleven.............golden gate ten victor eleven
on high band........."

I never actually heard Golden Gate reply.

I'm headed to Boca Raton next week and I thought I'd take my scanner.
Can someone please post police/fire etc. frequencies.

Also, anyone know of some good scanner shops in the area?

Thanks in advance.

Paul Hancock

They can't sell them anymore because they are easily modified to recieve
cellular frequencies directly (not images). New scanners can't be modified to
recieve these frequencies, however many of them can pick up images of the
frequencies.

For all those in the debate as to whether or not litstening in on radio communications is legal, here's a thought:

It happens. Guard what you say, or get digital encryption equipment to do it for you. Somebody's listening, whether you like it or not, whether it's legal or not. Debate all you like. It happens.

I'm not trying to start a war, just playing a little. :)

From: clint.bradford@woodybbs.com
Message-ID: <93.4867.7592.0NFBB5FC@woodybbs.com>
Source record: 247499

Subject: Re: GMRS licensing requirements?

>>Current GMRS licensing fee is at $75 for 5 years (this is what I was
>>told by the FCC Land Mobile / GMRS branch in Gettysburg, PA).

That is not correct.

The long-awaited (partial) reduction in user fees for GMRS licensees
went into effect September 18, 1995. The user fee will drop
from $7/yr to $3/yr, or down to $15 for a five-year license.

This reduction will affect applicants for NEW or RENEWAL
licenses. The application fee remains at $45 (ugh!), so the
combined application and user fee will come to $60. (Still too
high, IMHO.)

This reduction in user fees will NOT affect applications for
modification of an EXISTING license. Instead, applicants for a
modification will continue to be assessed the $45 application
fee, but NO USER FEE. However, if the modified license is subsequently
granted, it will retain the original expiration date, rather
than starting the five-year clock all over again.

There's 574-INST.ZIP in the PRSG File Area on ATTENTION to Details BBS
that explains the licensing process is great (some say "excrutiating")
detail <g>, and gives nine examples of completed GMRS applications.

Nah, you can't. I asked this summer, and got several responses from sources "high up" that said 1) the software driving MDs is copyrighted and its distribution is tightly controlled, and 2) the data and/or the handshake is encrypted, so even if you do intercept it, your computer won't have the decode key. I would be suspicious of claims to have the key.

Pete.

##
Hmmmmmmm---- I have two BC200xlt batt. packs. One is now inoperative. The
other ,I recently overhauled. Main problem has been mechanical, in that both
batt. packs had manufacturing defect where the 12vdc input plug was offset
from the case hole and so much stress was placed on the plug that one pack's
plug came loose and the other's plug casing broke.
After repeated repairs I have been able to keep one pack going, using the
other one for parts (dumbly, I did not realize what my problem was at the
beginning or I would have returned the packs for replacement from the dealer
and/or manu.
The main part I have scavenged from the bad unit is the battery pack.
My modis operandi is to keep scanner plugged in and on charge at all
times. This has shortened batt. life considerably. I have, for the past six
months, let the scanner run all night (on min. volume) and then, in the A.M.,
start it recharging. This has "revived" the battery _only_ life cycle from 2
to 7 or 8 hours. The other way to get a complete discharge is to remove the
batt. pack and attach a 12v. flashlight bulb across the pack contacts. Let it
discharge all the way down. This should extend the length of the daily life
cycle--- presuming that you do not let the batteries get too warm using this
technique. Otherwise, I'm sure that someone here on this group will be able to
recommend the proper resistor to use in place of the bulb.
Do be advised that if you leave the batt. pack off too long, you will lose the
freqs. you have input.
The other cost effective solution would be to replace the shrink wrapped batt.
pack within the pack casing. You should be able to get a replacement nicad
pack for less that $15 @ Rat Shack or other electronic suppliers.
Keep us posted as to what you do.

I think the key to the problem is in that last sentence. That 2X mod may
have an error in it that's draining the batteries.
Try taking it out, and see if that solves the problem.
if not, buy an R-7100, with 900 memory channels ;-).

MM> intercepted, recorded, repeated to others, etc, this is the ONLY
MM> definition.

Whoa, here... The technical definition is as David quoted. The legal
definition is as Mike says.
Notice that the two are not the same. This is a common occurance today, as
the Government continues on it's trend of ignoring reality.
The FCC made the definition as it did because it (actually Congress) wanted
to bestow the illusion of privacy on something that is not private.

MM> The reason this is an important point is not so some ego can bloat. We
MM> have enough of this already. It is important because there are FCC
MM> publications which say things about broadcast transmissions, and
MM> broadcasts, which might lead someone to think that it is legal to
MM> listen to many kinds of radio transmissions which it is illegal to
MM> intercept, based on an uninformed belief that all transmissions are
MM> broadcasts.

Again, what *kind* of broadcasts? In reality or in law? As we see above, there's a difference. While the FCC (again, actually Congress) wanted to make listening to certain radio transmissions illegal, it did so by the expediant of re-defining 'broadcast' to fit what it wanted, instead of fitting reality.

MM> Ham radio operators are PROHIBITED from broadcasting. Some ham please
MM> confirm this so I won't have to listen to more ill-informed persons
MM> complaining about this.

There is a blanket prohibition against broadcasting by HAMs, with a few, very specific exceptions, which the average HAM will never come across.

MM> Oh, and Mr. Stark, please get a copy of CFR 47 and read it. Your library
MM> probably has a copy.

And, Mike, by the same token, you might want to get a copy of a book on radio, to see what broadcasting is in _reality_.
Not a flame, really (I like your posts). Just information. In particular, this "broadcasting" deal get's confusing because there are two, conflicting definitions. We need to be sure which one we are working with.

You know, it is funny just how much you hate Bill. Enough to spend
inordinate amounts of time, and pouncing on such trivial bull, just
to that you can attempt to make your case.

Stupid actually. I mean, come on Andy. Let it go! You hate Bill,
that is evident, but you just persist, with such garbage!

And you know that is all there is, just your pathtic whinings,
even in your E-Mail to me, where you talk about how you hate him, and
are "Out to get him". (If you forgot that, let me know, and I can post
it back to you. I saved it)

BTW, if they let you back on the FIDO, you would see where a gentleman
in MN is doing some experiments with TV antennas for scanners, and has
found so far that they do exhibit gain, much like the ones I used to use,
before having free access to commercial antennas.

But let it go! It is pathetic at this point.

Andy, the big Gotcha with the OPTO unit is you have to dedicate your
computer to the scanner, or at least multitask it, to use it.
HB/CE-232 does not have that requirement. It does what I want.
During heavy snow, or newsworthy events, I can reprogram the scanner
in a few minutes, then go back to whatever I was doing on the computer
while listening to the scanner.

If I'm not mistaken,the OPTO unit does not improve the "performance"
of the scanner, that is the RF characteristics are the same. While
Cheeks unit doesn't add DTMF or CTCSS, it will allow some functions
you could not have had without it. Like searching and storing to a
text file. I've heard some pretty creative uses for the user
switches, too.

I guess ideally, I'd have both, but if I had to pick, I'd pick the
CE-232.

847. an HT from Hong Kong?

Newsgroup: rec.radio.scanner
Date: 1995-10-21 00:00:00 UTC

Folks,

I'm new on the amateur radio scene and need some advice. I'll be going to Hong Kong soon and am interested in shopping for an HT. What can you advise me about:

* Brand
* available frequencies
* legalities
* costs

Even if you don't know anything about "export only" HT's or Hong Kong, I'd appreciate your responses about Brands and costs. I'm planning to spend about $400-500 in HK on such a unit.

I've got friends who will guide me through the licensing process and hook me up with the local Ham groups (Bay Area). I intend to go legit and certainly wouldn't want to break any laws by importing something with extra frequencies ;-)

Imagine, though, that you could pick up anything available in the $400-500 range. What would you get?

Thanks,

Mike

>to Hong Kong soon and am interested in shopping for an HT. What can
you
>advise me about:

I'd save myselft the trouble and buy from a stateside distributor, I've heard of guys buying overseas HF gear with features or bands not avail. in U.S but I've never heard of any great bargains. What you save by shopping Hong Kong may cost you quickly if you have a problem or need an accessory for the radio.

I have a Kenwood Dual band HT and like it alot.

: of legal uses for such equipment. You just can't legally use it
: for unlawful purposes - monitoring cordless is currently unlawful.
: *I* happen to also think of it as voyeurism and quite sleazy.

Excellent arguments, Curtis. When listening to cellular phone calls on scanners became "cool" I dashed out and bought one of those cellular down-convertors. I think I logged about 3 hours of listening on it before putting it back in the box. I sold it a year or so later with the original battery in it.

The only truly useful thing that I've found for listening to cellular is to catch what the big-shot-cops convey back to the police station when something "big" is going down. The cops here will use their in-car cellphones when they want more "privacy" at accident scenes, hostage takings, murders - these are pretty rare occurances in Toronto, BTW.

It struck me that the majority of people who use cellular phones are:

- really boring
- in the process of breaking up a relationship
- prostitutes
- drug dealers
- speaking in a foreign language
- idiots

I couldn't believe I spent the money to listen to this sort of crap. The way I see it, one must really have "no life" if they find any of the above interesting.

Some people seem to be under the impression that Canadian Radio Shack scanners can still receive cellular. Guess what? Canadian Radio Shack scanners have never been able to receive cellular without the modification of the diode init' matrix. I hope not too many Americans are taking side trips up here only to be dissappointed upon their return to the US.

Now that the mod's are very difficult guys like Bill Cheek (aka Butt Cheek) have little to write about in their mod' books. It reminds me of CB radio years ago where it was easy to modify CB's to cover more than the regular 40 channels. Now it is very difficult - but not impossible. 8-D

I've devised a modification to the 2035 scanner to restore the cellular coverage. However, I would have to charge about 100$ to make it worth my while and if others feel just a little like me about cellular coverage they are hardly going to want to pay this much for the "privelidge".

Cheers!

Andy

The average CHP mobile kicks out about 100 watts...hardly low power by
public safety radio standards.

And yes the CHP uses Mobile repeaters/extenders on 154.905

This is good for a few miles and a good alternative for those without
good lowband antennas.

Sorry Jim...you have been busted down to Lieutenant for one week. Go back
two baby steps.

I think you have it backward here. You are applying the term in it's
broadest (wide) sense. The legal definition is more strict (narrow).

>>) Therefore, I stand by my contention that an unencrypted

>
> The FCC definition is not "technical", it is "legal".
>There is a big difference between the legal definition of a
>term and what it actually means. That is the whole problem
>with ECPA and its related legislation.

The FCC definition of "broadcasting" is certainly more technical, in
addition to being legal, than anything in the American Heriatge
Dictionary. In fact the first definition offered here from the AHD shows
a lack of technical information..."To transmit by radio or television".
From a technical standpoint, using the words "radio" and "television" is
redundant. They're both radio.

> The word "broadcast" still means what it has always
>meant, despite the attempts of Congress and the FCC to

>define the laws of physics and nature.

How does narrowing the definition of a word like "broadcast" for legal purposes change or define the laws of phyisics or nature? What's the scientific definition of "broadcasting"?

The definition of "broadcast" and "broadcasting" used by congress and the FCC, and applied to telecommuncaions, is in line with the definition of "broadcasting service" by the International Telecommunication Convention, Malaga-Torremolinos, 1973.

"A radiocommunciation service in which the transmissions
are intended for direct reception by the general public.
This service may include sound transmissions, television
transmissions or other types of transmissions."

> It is the legislators who are uninformed, not those of
>us who actually USE the technology and understand what is
>really happening.

But when we talk about privacy over radio we are not talking about technololgy, we are talking about law.

I have the technology to tap into your home (wireline) telephone, but the law says I can't do it. Face it, the only reason that you assume your wireline phone calls are private is because the laws says that wiretapping is illegal - not because wiretapping technology does not exist.

>
>>Ham radio operators are PROHIBITED from broadcasting. Some ham please

>>complaining about this.
>
> I am an Extra class ham operator and have been licensed
>for 14 years, thank you very much. I understand that we
>cannot violate the LEGAL definition of broadcasting
>(actually, I believe the phrasing in Part 97 refers to
>"one-way transmissions" - the word "broadcasting" appears
>in ARRL summaries of the rules).

There is phrasing in part 97 that uses the word broadcasting:

97.3(a)(10) Broadcasting - Transmissions intended for reception by the general public, either direct or relayed.

97.113(b) An amateur station SHALL NOT ENGAGE IN ANY FORM OF BROADCASTING, nor may an amateur station transit one-way communciations except as specifically provided in these rules... (my emphasis).

Broadcasting is prohibited in the amateur service. Period. Other types of specific one way communications are permited but they are not considered broadcasting.

> The law says, in effect, that if you don't INTEND to
>"broadcast" your unencrypted analog radio traffic, then it
>is legally "private".

That is true for the most part but there are legal exceptions.
Transmissions in the private land mobile service and amatuer service, to
name a couple, are not intended to be received by the general public
However the law specifically allows for them to be monitored by pretty
much anyone. Even more, you can disclose information you obtain from
monitoring amatuer radio, and even use it for personal gain.

This is all legal stuff and has nothing to do with technology.

> The real world demonstrates that, regardless of the
>sender's INTENT, any unencrypted analog radio transmission
>has been "broadcast" (in the dictionary sense) and cannot
>be "private", any more than yelling your message across the
>street is private.

There's a bit of difference. Anyone that overhears me yelling something
across the street could not help but do it... Do you know anyone that can
turn their sense of hearing on and off? Sometimes I wish I could.

I don't think you are applying your definition ("in the dictionary
sense") correctly. Under the dictionary definition you offered, anything
transmitted by radio, whether encrypted, unencrypted, analog or digital,
is a broadcast. If the FCC used the AHD definition, all of us hams would
be in violation of 97.113 the moment we keyed up - right?.

I was in Hong Kong this summer, staying in the Causeway Bay area. I
was completely surprised by the number of authorized Icom dealers in
the city. It seems like most if not all camera/electronics stores
sell Icom. I saw some Kenwood, Standard, etc.
Prices were never ever posted- there were coded tags on the items, and
the clerk would tell you, or show you a calculator with the amount. In
my experience, prices were similar to here in the US, in most cases
higher in HK. Some observations:
1. They had a lot of older stuff- dusty in fact. 95 percent was at
current "high rent district" list price. One store, Wilson Camera,
8 Great George St, was giving decent prices on older gear that was
getting dusty.
2. Most if not a □□ll of the gear was in the Asian/Japan
models- 440 gear ran on 430, and there is a great tendency for
the extended recieve we see on US 2M gear to be disabled.
3. Prices as I say were about US or more.
4. There will be a real warranty problem, unless you ship
it back to the dealer in HK
5. I believe the hma radio dealers in HK cater to tourists, such
as the Japanese, who have high prices at home, and would
benefit from the lower taxes, etc. in HK.
6. I am not sure what if any ham operating is done in HK- in China,
there may still be restriction on private stations. In HK, I saw
a business (actually a Chinese dining room) running on Yeasu HTs
on 145.00 Mhz.
7. There were some odd and ends of other brands of gear, even at
the airport gift shop- brands I had not heard of.
8.
My big buy in 2 weeks a was an Icom BP24 I found in a pile of
older packs at Wilson. I paid $67US for it, thinking it was
the last one on earth. On the same trip, I bought a copy of CQ
magazine for $11.00 US and found Ross Distributing with the same packs,
price.

Would I go back- yes. Buy some gear- maybe. Fun place- I have never
been in more Ham Radio dealers in my life.

73,
Erik

Tell that to K1MAN on 14.375mhz. He regularly broadcasts and even
has guests on his show. He does it by using the loopole of broadcasting
"for informational purposes".

Forget the exact FCC wording that lets him do this.
Many have tried to get him off the air, but he is still there.

That frequency is for the California State Police which I understand
has been merged into the CHP, or visa versa. I've heard CHP on CSP
freqs. also, here in San Francisco.

>At one point I heard a mobile unit trying to talk simplex with Golden
>Gate and the mobile referred to "high band" like this, "golden
>gate.......ten victor eleven.............golden gate ten victor eleven

I've heard both sides of the cinversation here, but as with most
folks, it's difficult to hear the CHP mobiles on low band. I can hear
them on the extender freqs. if I'm within a few miles of them.

JW>+-jim

<cool beavis and butthead tagline deleted for space>

chp mobiles are EXTREMELY difficult to receive unless all your gear is
at peak performance levels. this is very difficult to acheive and it
often makes your equipment somewhat limited in other radio bands. if
mobile, the best thing to use for an antenna is a full length 9-ft cb
whip or similar 1/4 wave whip cut to the frequency range (42MHz). if at
home, try using a 1/4 wave or better GROUNDPLANE cb base antenna (sorry,
no telescoping antenna or magnet mount job on a rain gutter is ever
gonna cut it with the chp mobiles.)

as far as the chp mobiles being low power, this is not true. the
mobiles are typically 100 watts. the only units that use less rf out ar
e the motorcycle units, which average around 25 watts. funny thing is,
i often end up hearing them better than the mobiles. hmmm.....

...
AM> : Therefore, I stand by my contention that an unencrypted
AM> : radio signal cannot be "private" because it has been
AM> : "broadcast" by radio.

AM> Nonsense.
...
But, doesn't it depend on the definition of "private"?
According to the legal definition (at least here in the states), certain unencrypted transmissions are private.
However, in reality, they are not private.

Here, for example, cell and cordless phones are, legally, private, and therefore illegal to monitor.
However, such conversations are less private than if the people having the conversation were on a busy street corner, in reality.

In my opinion, the fact that the gov't made a law stating that these conversations are private, and by upping the stakes with the TDDRA, actually made such conversations LESS private, in reality. WHy? Because now, more people than ever are looking for ways to listen in, who never would have considered it if the gov't hadn't made such a thing out of it.

Just my opinion.

Message-ID: <46ccph$19io@usenetw1.news.prodigy.com>
Source record: 247513

SUBJECT: Milwaukee Wisconsin FIRENET
Firenet is a paging service available to any interested fire buffs.

The service provides an alphanumeric pager that will inform you of all working fires in the area. Also included are any special or unusual responses of area departments.

Greater alarms from around the country are also paged out. The service operates 24 hours a day, however the out-of-state greaters occurring overnight are not paged out until morning.

An optional alternative service, FIRENET LITE, pages out only local greater alarms, 24 hours a day.

The pager can also be used as a normal numeric pager, whereby, someone can call the pager number and key a numeric message (such as a phone number that you should call) through their telephone keypad. Great for family, friends or employer to get hold of you.

Cost is $15 per month. E-mail me if you want more information.

I am going to a computer-controllable scanner, and so am selling my UK-spec Yupiteru MVT7100 full coverage scanner. Yes, it does get cell phones etc, although of course you're not supposed to be listening to them...

It's been used, but is in very good condition. Comes with all original accessories other than the ac adapter, which only worked in the UK anyway, so I left it there...

Yours for only $575+shipping. Either email me at "wally@msn.com"; or leave voicemail at my work number in Seattle - 206-889-5218.

877. Using a CI-V interface with an AR8000

Newsgroup: rec.radio.scanner
Date: 1995-10-22 00:00:00 UTC
From: an410470@anon.penet.fi
Message-ID: <130310Z22101995@anon.penet.fi>
Source record: 247519

HOW TO MODIFY YOUR ICOM CI-V INTERFACE TO WORK WITH THE AR8000
==========

The CI-V interface employs a very common level converter chip - namely the MAX232. On the TTL/CMOS level side of things (pins 11 & 12 of the MAX232), the TXData and RXData lines are bridged together to make it CI-V compatible. This single line, consisting of both TXData and RXData lines bridged together, is fed to four mono jack sockets providing four CI-V connection points.

To use the interface with an AR8000, the TXData and RXData lines need to be seperated and connected to the AR8000 as two seperate lines.

Here's some more detailed info:

Find pins 11 and 12 on the MAX232 cip in the CI-V interface. On the PCB, close to these two pins, you will see they are bridged.

Using a sharp blade or something similar, cut the track in such a way as to "disonnect" the two pins from each other. One pin will now still be routed to the four jack sockets while the other will be going nowhere.

Remember that in order to use the interface as a CI-V interface these two lines must be bridged together but to use it as an interface to your AR8000 the two lines must be seperated. To make this switchover easy you should to fit a switch in order to allow easy bridging and unbridging of these two lines.

Fit a stereo mini jack socket to the CI-V interface casing.

Connect the ring and tip of the new socket to pins 11 & 12 respectively of the MAX232 chip.

Connect the ground of the new socket to pin 15 of the MAX232 chip.

If you choose NOT to fit the bridging switch mentioned above then, in order to use the CI-V interface as a true CI-V interface you can bridge the TX and RX lines (pins 11 and 12 of the MAX232) by simply inserting a stereo jack plug into the newly fitted stereo socket making sure that this jack plug has had its tip and ring connections shorted together. I prefer the switch method because it's neater and easier to use but it's not essential.

Once you've done all of this your CI-V interface will have had a stereo mini jack socket and a switch added to it. The switch will switch the interface between CI-V mode (when closed) and AR8000 mode (when open). The stereo socket will provide a TTL/CMOS level serial

port connection with connections for Ground, TXData and RXData. This is exactly what the AR8000 needs.

These three lines should be connected, by means of suitably made patch lead, from the CI-V interface to your AR8000.

In my case, I fitted a stereo jack socket to my AR8000 which allows easy connection to a Scout or to the CI-V interface.

The socket fitted to my AR8000 is connected to the appropriate three pins (GND, TX & RX) of the existing flat flexible connector in the AR8000.

That's all there is to it. The diagram below will hopefully make it even clearer.

"Broadcasting", as defined by part 97, is a one way communication(s) intended for reception by the general public. Code practice, and other limited one way communications that are not intended for the general public are not considered "broadcasts" under amateur rules. They are considered permitted one way communications.

The only time that any "broadcasting" is allowed in the amateur service is when normal means of getting information to the general public is unavailable (ie emergency, disaster situations).

I own one. Like it very well for the money. The older one would also
cover all of 800 Mhz when modified.

Well...

Reviews are only someone elses opinion. I value none higher than
mine. I have no idea what axe is being ground therebouts. Nor do I
care.

I will do business with whomever has product or service I want/need.
Personalities are irrelevent.

I did try the opto unit, I NEED to dump a mess of freqs to the radio
on ocassion, unplug and haul the radio elsewhere. the Opto Won't do
that.

As far as the HB232 being a 'hack' it is. A dan'g near milspec done
by some sharp dudes on the cutting edge of technology, tho' the
programming is somewhat remis. (How much of the programming is lacking
may be due more to security restraints on the programmer than on
inability.) It was engendered by active duty Militairy Personel. They
have to be super cautious whenever working on freemarket products.

That you have a personal beef with the marketing personel is only a
problem to you. I am posting my reply to you public as I feel it is
important that folks who have recived private mail from you understand
that your 'opinion' is warped by a personal vendetta having nothing to
do with the product in question. May you grow out of your childish
condition soon.

Good Signals... LCM

I heard them today (10-22-95) at Ellington A.F.B. TX, someone had posted
the following list & it worked great.

Demonstrations 1 - 263.350
Demonstrations 2 - 275.350
Demonstrations 3 - 307.700
Demonstrations 4 - 302.100
Maintenance Alpha - 142.000
Maintenance Bravo - 143.000
Maintenance Charlie - 141.560
Maintenance Delta - 142.025
Air-to-Air Tac 1 - 241.400
Air-to-Air Tac 2 - 245.900
Air-to-Air Tac 3 - 250.800
Air-to-Air Tac 4 - 360.400
Air-to-Air Tac 5 - 384.400
Air-to-Air Tac 6 - 391.900
Air-to-Air Tac 7 - 395.500

The busiest of these will probably be Demonstrations 2

Thanks to whoever posted this freq. list the first time around...

B.T.W. will your scanner pick up military air ??? Generally speaking only
the high end scanners do...

Interesting experiences you are all having with the batteries.

I have owned a 100xlt and I now have a 200xlt I picked up second-hand.
I *believe* both had the low battery indicator function disabled. In
any case, I feel I have had outstanding service from them.

I used each radio in the same fashion. I'd run it a couple hours a
day, mostly in the car, and charge it overnight twice a week. Neither
one ever ran low unless I specifically left it on for a lengthy
period -- overnight, for example.

Perhaps the low battery indicator disabling made a difference, or
maybe I was just lucky with my service, I don't know...

)(10) Broadcasting. Transmissions intended for reception by the general
)public, either direct or relayed.
)
)
)That's how they call it and they make the rules.

Thank you, Woody. This subthread got started when I pointed out that
people use the term broadcast when they really mean transmit (using the
technical definitions, of course). This can lead to real problems when
discussing the legality of intercepting various transmissions. It is
legal to intercept, and record (for one's own use) broadcast
transmissions.

Portable (cordless) telephones DO NOT BROADCAST. They TRANSMIT.

Erik Westgard (71505.341@CompuServe.COM) wrote:

: I was in Hong Kong this summer, staying in the Causeway Bay area. I
: was completely surprised by the number of authorized Icom dealers in
: the city. It seems like most if not all camera/electronics stores
: sell Icom. I saw some Kenwood, Standard, etc.
I've visited Hong Kong several times and purchased a radio or two
on occasion. Let me compare/contrast my experiences.

: Prices were never ever posted- there were coded tags on the items, and
: the clerk would tell you, or show you a calculator with the amount. In
: my experience, prices were similar to here in the US, in most cases
: higher in HK. Some observations:
: 1. They had a lot of older stuff- dusty in fact. 95 percent was at
: current "high rent district" list price. One store, Wilson Camera,
: 8 Great George St, was giving decent prices on older gear that was
: getting dusty.
Yes. Amazing how old some of the stuff was. Actually worked to
my advantage in one case since I wanted a model that was no
longer available in the U.S.

: 2. Most if not a □□ll of the gear was in the Asian/Japan
: models- 440 gear ran on 430, and there is a great tendency for
: the extended recieve we see on US 2M gear to be disabled.
Major problem here. Watch out for versions of equipment that
are setup for non-US markets. Its not always easy to figure
out in advance, either.

: 3. Prices as I say were about US or more.
I'd give them more credit than that...but its not always easy to
tell the rockbottom price with extensive negotiation.

: 4. There will be a real warranty problem, unless you ship
: it back to the dealer in HK
: 5. I believe the hma radio dealers in HK cater to tourists, such
: as the Japanese, who have high prices at home, and would
: benefit from the lower taxes, etc. in HK.
Actually, I am not sure WHO they really cater to. The prices
I've seen in Tokyo are roughly equivalent to Hong Kong.
Exchange rate would influence this, of course.

: Would I go back- yes. Buy some gear- maybe. Fun place- I have never
: been in more Ham Radio dealers in my life.

Check.

: 73,
: Erik

904. Regency MX-7000

Newsgroup: rec.radio.scanner
Date: 1995-10-23 00:00:00 UTC
From: leigh@rain.org
Message-ID: <46f3om$9uj@news.rain.org>
Source record: 247453

A friend has recently picked up an older scanner, a Regency MX-7000. It has a very impressive frequency range, but the scan speed is extremely slow. I checked the ftp oak.oakland.edu site, and found a badly written mod file that does not quite make sense to me. I'll post it below, and hopefully someone can clarify it.

"THERE IS A POPULAR MX7000 MOD WHICH IS ADDING A RESISTOR IN PARALLEL WITH ONE ON THE CPU BOARD TO INCREASE SCAN/SEARCH SPEED. BY CHANGING C3 FROM 33pf TO 8pf. YOU DON'T NEED TO DECREASE THE RESISTANCE AS MUCH WHICH YIELDS LONGER MEMORY BACKUP."

Can anyone clarify this? Which resistor on the CPU board are they refering to?

Thanks. --Leigh/KM6JE.

905. PORTABLE ANTENNAS

Newsgroup: rec.radio.scanner
Date: 1995-10-23 00:00:00 UTC
From: andrew.forrester@canrem.com
Message-ID: <60.26256.5773.0N1FA593@canrem.com>
Source record: 247454

Being the proud owner of a new Pro-43, I am happy to report that
the antenne supplyed with the scanner really sucks big time.
Monitoring the posts for awhile, this seems to be a common problem
with many portable scanners. Great scanners, but they cheaped out
on the ducky. My yellow guy did not even come with a connector on him,
so perching him atop the scanner is a real balancing act.
It really draws the stares as well. :)
Soooooo.
Who knows of a Really GOOD replacment antenne that is Great in all
bandwidths as well as the 800 MHz range. For my use, 25-1.3 MHz
If you have had a good experience with a purchased antenne could you
give a brief desc. of it, price, and where to purchase it.
This could be a valuable post for all in need of a better antenne.

BTW, has anyone had good experiences with signal amps for portables?
Are they big bulky units or what.

While Im at it why not throw in the kitchen sink and let us know if
there is any car mounts for portables (Pro-43) or even a nice corinthian
leather case, and where does Bill Cheek get those 850 mAh nicads.

Please deposit your lifes amassed knowledge in this conference so
others can benefit as well.

Thanks for all who can find the time to respond.
We might not mention it all the time, especialy the ones in the background,
but we do appreciate (and use),the information offered by others.
Now get back to work. Opps, wrong memo. Sorry. ;)

Andrew Forrester.

The MVT 8000 description is a brilliantly designed angled front panel, 200 channel ac/dc scanner. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on my desk.

It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.

Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:

Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)

Of course, you can change factory settings. It also has a battery save function.

I would like to add to this thread - I was there not too long ago and I got the feeling many stores were more "communications" stores. They had ham, two way, commercial HF, you name it. Whatever you wanted, whoever you were, they were happy to sell it to you. Perfectly legal, of course, as it would be in the US, as long as you didn't try to use it here, or in HK. I suspect the HK government keeps after toursts trying out their new toys before they leave!

I also found the HK shop keeper's to be the nastiest, most disinterested, discourteous S.O.B.'s I have EVER run into. It was so bad I asked my hotel manager what I was doing wrong. He said "probably nothing", adding "being Caucasian and wanting less than 10 of anything was not a good combination for many sales people; a serious problem in HK". All of this right after visiting Tokyo where the HAM (REAL ham) stores where SO polite and friendly I literally could not believe it.

>
>Folks,
>
>I'm new on the amateur radio scene and need some advice. I'll be going
>to Hong Kong soon and am interested in shopping for an HT. What can you
>advise me about:

One thing's for sure - you will have a fantastic choice of radios! I felt guiddy every time I went shopping.

Every shop in Kowloon sells ham equipment, as well as walkmans, dodgy watches, tee-shirts, sunglasses, you name it, they sell it.

The problem is that there is no such thing as a ham only store (well I didn't find one in the four months I was there). So expert advice is difficult to get.

There are stories abound of people getting ripped off (especially in electrical shops), if it's anything to go by I didn't buy anything while I was there - the fantastic cheap bargins everybody hears about arn't there. The prices seem to be the same as in the UK (eg the newish Sony SW-100 was about 240 sterling).

Save your self a LOT of hassle and buy local - and start up a friendship with the local ham store owner - much better in the long term.

PS I use an ICOM IC2SA and an ICOM IC24SAT, both very reliable - long in the tooth but do everything that the latest all singing HTs do.

My IC2SA has extended TX/RX and even works on marine (156 and up) and Airband RX down to 115MHz.

Good luck in HK, an evening meal in the art-deco cafe on the peak is not to be missed, book a window table and enjoy the view (fond memories flooding back now).

I agree with Tim. I've been to HK several times on business trips and it is not worth the hassling of dealing with the salesmen over there (prices are not fixed and you have to deal, yes as in bargaining!). Also there is the problem of the warranty. I don't think any of the major brands (K,I,Y) honor warranties of any equipment bought overseas. What I have bought though are accessories. Bring your AES catalog to check the price differences. Some things are cheaper there but others are around the same or even higher depending on the store. Another suggestion is to get away from the Nathan Rd. stores, those are usually overpriced.

Have fun in HK.

David Retzik (dretzik@uoguelph.ca) wrote:
: My boss at work walks around with a portable Mottorola phone that looks
: very similar to a walkie talkie. The most I can come up with is I saw
: the word "Radius" on the phone one day when he set it on his desk. Can
: anyone tell me what frequency he might be on? Sorry I can't be more
: helpful with exactly what it is but I have never seen one of these
: before. If possible please e-mail me your response.

Well, the RADIUS *is* a handi-talkie, not a phone. It may very well have phone patch capabilities but is not a true cell phone nor a cordless phone. Depending upon the type of work that the business is involved in it be licensed to any number of frequencies (*thats* not much help now is it...) or it may simply be set on one of the itinerant freqs (not too likely *if* he has phone patch capabilities).

Now the bright side... IF you find the freq you can be (fairly) sure that you're violating any of the federal or state statutes regarding monitoring of phone conversations (not that it stops many folks, anyway).

Check these freqs out first:

Freq	Mode	Ident	USE
151.625	NFM	Red Dot	Itinerant
151.955	NFM	Purple Dot	Itinerant
154.570	NFM	Blue Dot	Itinerant
154.600	NFM	Green Dot	Itinerant
462.575	NFM	White Dot	GMRS
462.625	NFM	Black Dot	GMRS
462.675	NFM	Orange Dot	GMRS
464.500	NFM	Brown Dot	Itinerant
464.550	NFM	Yellow Dot	Itinerant
467.7625	NFM	J Dot	
467.8125	NFM	K Dot	
467.850	NFM	Silver Star	
467.900	NFM	Red Star	
467.875	NFM	Gold Star	
467.925	NFM	Blue Star	

If he's not there you can start a search bwtn:
150 - 161 Mhz and 450 - 460 Mhz

If he's not there he could be in the 220 -222.95, the UHF T-band (what is it??? 487 - 492 or,something like that) or maybe up in the 800 or 900 mhz band. You can tell a lot from the size of the antenna on the radio.

Another way of detecting close range radio communications, is programming the mobile transmit frequency, if a repeater system is being used. Mobile transmit frequencies are usually low to mid-powered, so a two to three mile range of reception would be easily achieved. Pick up a Police Call frequency guide to find these frequencies.

Bottom line...

Whether it's "right" or "wrong", legal or illegal...if you transmit unscrambled analog radio signals out across the airwaves, someone WILL be monitoring your transmissions. So either be aware of this and limit your conversations accordingly or else take the neccessary precautions to encript your signals.

Yes, this is true. It is a "discontinued" item at Radio Shack, because the
Police Call people announced a new book, out 1Q 95 (Jan/Feb). However,
it may still be available in certain Radio Shacks... even though it was
discontinued, my RS guy did a regional stock check using that fancy li'l
computer they have. The stores will sell out what they have, and don't take it off
the shelf.
He found 3-4 stores in my area that still showed stock, and he called and
found one for me (I also got "Beyond Police Call") which I went and picked up.
But I'd do this quick, as they were out in most of my area stores.

(I'm in Seattle, but I imagine you may have the same luck/bad luck. Keep trying,
and don't trust the one employee you talked to; call several stores; you can
always ask them to ship to you).

I just bought my first scanner, a Uniden Sportcat 150. So far I am pretty
happy with it (I have very limited experience in the matter...), but I was
thinking of upgrading its antenna. I wouldn't want to hassle with a
rooftop one, just another whip of better performance.
I read of one "condor" antenna from Austin (I think. The catalog is at home
and I am at work.). Has anybody any experience with that type of antenna.?
Does really improve reception, or I would be wasting the 30-35 $ it cost?
Any real life experience would be appreciated.
Thanks
Marco Ciocca

I own a Regency MX-5000 scanner and I performed the scan speed
modification you described in your post.

Its been quite a few years now, and I can recall the specific
location on the schematic, but basically it has to do with a 1/4 watt
resistor soldered in line on the CPU board, located just behind the key
pad.

I wish I can recall the exact spot for the jumper, but I received the
instructions for the mod from Grove Electronics and I bet they still
have the article on file. Try giving them a call at 704-837-7081.

Jack McGee (jmcgee@mail.orion.org) wrote:

: Andy, the big Gotcha with the OPTO unit is you have to dedicate your
: computer to the scanner, or at least multitask it, to use it.
: HB/CE-232 does not have that requirement. It does what I want.
: During heavy snow, or newsworthy events, I can reprogram the scanner
: in a few minutes, then go back to whatever I was doing on the computer
: while listening to the scanner.

Well, with the Opto unit there is no waiting to reprogramme at all. You are correct in that the scanner and computer become one. However, the PRO-2006 doesn't "go mobile" very well anyway (there's no mounting bracket and it's kinda big) and I know of nobody who uses one in their vehicle.

: If I'm not mistaken,the OPTO unit does not improve the "performance"
: of the scanner, that is the RF characteristics are the same. While
: Cheeks unit doesn't add DTMF or CTCSS, it will allow some functions
: you could not have had without it. Like searching and storing to a
: text file. I've heard some pretty creative uses for the user
: switches, too.

Actually, the Opto unit will make the scanner scan faster. This is a result of the way in which it is engineered - to take charge of the radio. The DTMF and PL/DPL decoding are BIG pluses to be sure. Cheek's CE-232 merely "fakes" keystrokes on the keyboard and reads the data dumped to the display. It is still working within the limitations of the basic scanner microcode. It adds no "intelligence" to the radio. It should be considered a "loader" device whereas the Opto should be considered a "firmware upgrade" with built in communications port.

: I guess ideally, I'd have both, but if I had to pick, I'd pick the
: CE-232.

With the Opto you really don't need the CE-232 and that is my point. Plus, you'll be up and running with the Opto-456 much sooner than with Cheek's "kit" which takes hours to build. Given the price differential the Opto 456 is the clear winner and worthy of investigating if one is considering dumping money into Cheek's kit.

The experiences that I've had with Bill Cheek have not been favourable either and I would not encourage anyone to deal with him. Cheek seems to think that his new customer's are out to rip him off. He wrote of this in his World Scanner Review a little while ago so I can't think that he would be too eager to back up anything he sells. Optoelectronics however is an established professional company with a broad and successfull product

line. They don't operate out of a garage and use a single phone line for data and voice correspondence. They have a toll-free number. Optoelectronics doesn't publish stale, stolen, misleading, biased and erroneous information in publications either.

You decide! 8-D

Cheers!

Andy

On trunked radio systems, there is a control channel that has only data on it. This is used to control the field radios, much like a cellular system. Other data is probably digital crt communications to and from police cars with license and description (27, 28 and 29 stuff) information. Anyhow, that's what we have here in Suburban Milwaukee.

Nels....

937. Re: Thoughts on radio privacy

Newsgroup: rec.radio.scanner

From: kjn@netcom.com
Message-ID: <kjnDGxHGr.FKx@netcom.com>
Source record: 247394

OK. So, I can see that the intended thread has gotten sidetracked onto the defination of "broadcasting" rather than the topic of "interception" and privacy which, as I read it, is what Robert was inquiring about...

Robert I Sinclair (robert-s@ix.netcom.com) wrote:
: If you intercept a broadcasted [transmitted] radio signal on your own
: property and listen in on it (but were not the intended recipient) is
: that wrong to do?

Personally, I subscribe to a more "libertarian" philosophy when it comes to communications. I tend to agree more with the tenants on the Communications Act of 1934 than the ECPA of 1986. The 1934 act "promoted" the act of receiving communications (both "broadcast" and two-way). The 1986 act "prohibited" the act/art of certain aspects of the radio monitoring hobby. I consider the "wrong" to be on the part of the government in this regard and NOT upon the listener.

: Who should assume the responsibility of radio security? The originator
: of the transmission or legal restrictions to possible eavesdroppers?

Clearly, the originator should take precautions to keep his communications private if he doesn't want anyone to know what he is communicating. Problems arise when the govt. decides that it wants to establish a "prior restraint" solution to protect the interests of a single area of business. If a transmission is sent in the clear then it should be fair game for interception. After all, "knowledge is power". If you know that your communications is compromised then WHY would you transmit it??? Especially when *inexpensive* technology exists that would protect it.

The act of legislating a prohibition to the act of monitoring doesn't make the transmission of information secure. In fact, it makes the whole process *less* secure due to the establishment of a false sense of security on the part of less sophisticated users of the technology.

: What would constitute malicious interception of a transmission?

In my opinion there is no such thing. There may be malicious USE of information gained by monitoring but the *act* of monitoring is NOT, in itself, malicious.

: Who is the rightful owner of a braodcasted private communication?

There is no *owner* unless some effort was made to protect the communication either thru encryption or by sending it down a privately owned piece of wire. If you snatch a communication by intruding upon someone elses property then you should be subject to legal action and restraint. If the communication freely enters MY property then I consider it fair

game...

: Should it be considered acceptable (legally, socially, morally)for
: purported private communications to be intercepted by parties that are
: not the intended recipient?

Sure. Why not? IF you throw something away do you maintain ownership ad infinitum??? If you stand at the street corner and yell at the top of your lungs to your stock broker 50 yds away that AT&T will hit $3,000 per share by tomorrow afternoon should you assume that anyone who overhears your "transmission" should be prohibited from acting upon what they overhear???

If you want something to stay private then *you* should assume some level of responsibility to keep it private. Precautions should be the responsibility of the communicator rather than "prior restraint" being placed upon everyone else who happens, as a normal part of their life, to wander down that same section of public street.

: should or would you be concerned about others listening to your
: "private" communications?

Nope! If I want a conversation to be secure then *I* should be aware of the technology and methods to keep it secure.

: If in commerce a competitor listened to two way radio transmissions of
: your company and used the information garnered in this manner against
: you. Would that be OK? Is that use of radio recievers considered legal?

In my opinion, no. I still subscribe to the philosophy expressed in Communications act of 1934 which made it "illegal" to use `intercepted' third party information for personal gain. Seemed like a reasonable compromise between two conflicting interests.

: Should the government be involved in the selection and administartion
: of encryption tools for private communications?

NO!!!! If they can crack it I have no problem with them trying. If *I* can crack it then I should be able to monitor it. I don't think it is proper for me to be free from legal reprisal if I use the information for personal gain but I should be free to listen in if the transmission untruded upon my personal being.

: Can the keys really be kept secured in that scenario?

For a while. It's certainly keep folks in work to build "better mousetraps".

: What if the key codes got out of secured storage?

Then I guess that the technology needed improvement.

: If a pay television microwave broadcast is intercepted and decoded to
: provide free viewing of the content would you consider this to be fair?

The key here is "decoded". If an individual unscrambled the transmission
then he has begun to cross the line. The originator has taken some
precautions against "free access" by encryting the signal.

If I want to "monitor" the scrambled transmission then I consider *that*
aspect my right and far game. If I used illegally obtained codes to intercept
the communication then I should be subject to legal action. If I sell fradulent
equipment I should also be legal responsible.

: What if you were the service provider?

I'd go after the illegal distribution of my services and at the same time
work to increase system security.

: Soon I anticipate major radio systems (I.E. municipal, public
: telephone, SMR services etc) to be converted to digital in the not so
: distant future. This will certainly make eavesdropping more difficult.
: Personally, I think that if you are using a radio system you are
: responsible for ensuring security.

I agree.

: However, I think it should be considered unlawful ford a third party
: intercept an encrypted transmission with the intent to decrypt and
: monitor the content without knowledge of the originating party.
^^^^^^^^^
Problems here... every transmitter of information should consider the
probabilty that their communication may be monitored and take the needed
precautions. I agree that some consideration should be made to those who
take precautions.

I have no sympathy for commercial cable companies who decode encrypted
transmissions (even their own) and retransmit the programming "in the clear"
from mountaintop microwave stations and then complain when individuals
monitor the UNencrypted programming. If they want to protect their
interests then they should maintain security all the way to the
subscriber's TV/radio.

Ken

I just got my Novemeber Monitoring Times yesterday. There is a good article about p.c.'s and upgrading them. It is usefull information. I use computers and radios and both together sometimes. To me computer applications in radio are interesting. It's good to see MT have a Web page and move forward in technolgy. This article is strictly about p.c.'s and from my viewpoint off focus. Maybe because I work with computers and networks all day I want to go home and read about radios to relax. Just my 2 cents worth.

943. Triple Conversion

Newsgroup: rec.radio.scanner
Date: 1995-10-24 00:00:00 UTC
From: jvc@bingsuns.cc.binghamton.edu
Message-ID: <46i8ae$3bf@bingnet1.cc.binghamton.edu>
Source record: 247400

To put it simply, triple conversion has an extra "filter" that blocks out most image frequencies, as opposed to dual conversion scanners which tend to pick up more image frequencies. The good thing about dual conversion is that if you have a scanner that's "cellular blocked" and it's dual conversion, you should pick up plenty of celluar images! This is all that the "laid-back" eavesdropper would need, but if you're going to hook your scanner up to your computer and do nifty things like tracking individual cars from cell site to cell site, you'll need the full celluar spectrum.

The newest trick is OTAP (Over The Air Programming) for the DVP/DES keys.
There is also an ID for the radio. Everytime you hear a transmission
there should be a data burst at the beginning. When they re-do the keys,
you will hear longer transmissions and from the base, then the mobile,
back and forth. DEA and Customs are using it here.

tubegod@cml.com (Andy Moss) wrote:

->However, the
->PRO-2006 doesn't "go mobile" very well anyway (there's no mounting
->bracket and it's kinda big) and I know of nobody who uses one in their
->vehicle.

Andy, it might help your argument if you didn't make erroneous
statements or make generalizations based on your own limited
experience.

1. Radio Shack sells a mobile mounting bracket for the Pro-2006. I
do not have the part number handy, but it is, or used to be, available
and I happen to own one. You have to order it as it's not typically
stocked by the stores.

2. I don't normally use my Pro-2006 in my vehicle, but I have done so
on special occasions (like the time I had two 2006's and an Icom
IC-R7100 sitting on a table in the back of a Chevy van). I know of a
handful of users, including an Indiana State Police officer, who have
Pro-2006's permanently mounted in their cars.

->Actually, the Opto unit will make the scanner scan faster. This is a
->result of the way in which it is engineered - to take charge of the radio.

True, though it is dependent on the computer software used to drive
the radio.

->The DTMF and PL/DPL decoding are BIG pluses to be sure.

Absolutely.

->Cheek's CE-232
->merely "fakes" keystrokes on the keyboard and reads the data dumped to
->the display. It is still working within the limitations of the basic
->scanner microcode. It adds no "intelligence" to the radio.

True, but it adds functionality. The CE-232 can download frequencies
to the radio much faster than a human operator could key them into
memory. For users who would like to be able to dump a computer file
of frequencies into their Pro-2006 and then operate the scanner
independent of a computer, like for mobile or emergency power
operation, the CE-232 has the Opto 456 beat.

->With the Opto you really don't need the CE-232 and that is my point.

Some users might. See above.

->The experiences that I've had with Bill Cheek have not been favourable
->either and I would not encourage anyone to deal with him.

OK, fine, so you've had bad experiences with Bill Cheek. Others,
myself included, have had good experiences with him.

->You decide!

In order to make an imformed decision, one must know all of the facts
and all sides of the story.

Bob...

Well, theres a bunch of Military freqs to tune to but I can't name all of them. Try the VHF marine channels as they will definitely need a Pilot. As for ships security, try the military VHF-Low bands. Thats what we used in Norfolk and most Navy ships have hand helds and repeaters for the ship. My ship did have new Motorola HT's with an encryption feature though. Good news is it's not used much (too much of a pain to get the security weenies to figure out how to make keys). Oh yeah try the Visible Light Spectrum!:-) The Navy uses flashing light and flags quite a bit!

>gonna cut it with the chp mobiles.)

Here in San Diego County, monitoring CHP mobiles was next to impossible unless I was receiving the mobile extender. The extenders are VHF High band, but are only on the the CHIP is out of the car and using a H/T. On day I was looking in the antenna section of the local RS. I saw a 5/8 wave base loaded "All Terrain" CB antenna on sale ($19.99). I took one home, cut 6 inches off the the whip and mounted it on top of my roof-top discone antenna. I now receive the CHP cars over 10 miles away. Steve in Escondido, CA

Andy, this shows either an intentional mis-representation of the CE-232, or
an ignorance of the CE-232. I don't know which, but it's got to be one of
the two.
You can log onto Bill's BBS, the same as anyone else, and d/l the specs for
the CE-232. Then you would know as much as the rest of us do about it.

> YIELDS LONGER MEMORY BACKUP."
>
> Can anyone clarify this? Which resistor on the CPU board are they
> refering to?

I can't recall the reference to a adding a resistor but C3 is a
capacitor which from memory was next to (or parrallel to) a resistor.

The CPU board is attached to the front angled section of the radio and
is easily detached from the main case. Remove the four screws on the
back and two on the underside at the front to remove the top/bottom
cases - 4 screws then hold the front section to the metal case - remove
these.

C3 (again from memory) is located just in from the edge on the right hand side
of the CPU board as you look at it (still attached to the front case) -
you should find it is marked "C3" !

You will probbaly find different value capacitors will vary the scan
speed - find one that works to your satisfaction - trying to go too fast
may result in the PLL not locking up and causing the receiver to "skip"
over transmissions rather than stop on them.

Grove is probably one of the best resources for scanner and frequency related
publications. Grove sells an FCC database in several forms. They have two
CD-ROMs available with all licenses in the US. One of the CDs has a mapping
program to visually display where transmitters are located($170). The other

CD is $100.
They also carry the FCC licenses for individual states. CA, TX and FL sell for $50 while all others are $40. I just ordered the NC one on 3 1/2" and should be getting it tomorrow. We'll see how it does.
Grove also carries the Frequency Almanac series of books which are published per state and list most of the FCC licenses. VERY HANDY book. I love mine. Breaks it down by counties and then by police, fire, EMS, businesses, etc. And it even has a frequency index in back just like POLICE CALL. The prices range anywhere from $10 for the small states to $25 for the large states.
I also noticed last night a write-up on the new Mr. Scanner CD-ROM in the November issue of Monitoring Times. This CD has all FCC licenses from 25MHz - 1300 MHz for $35 + $2 S&H. Depending on how the Grove database works out I might have to check into this one too!
Here's the phone numbers for those interested
Grove : (800)438-8155
Mr. Scanner : (800)423-1331

There is also a company called PerCON that sells several levels of CD-ROM frequency databases from $30 on up I think. They are located in Dunkirk, NY and usually run adds in most of the scanner mags but I can't seem to locate their phone number right now.

And no, I am in no way affiliated with Grove, Mr. Scanner or PerCON...just trying to pass some good info along to fellow monitors, scannists, etc.....

Good luck!

> Thanks,
> Cocp

You should probably check out the March 1995 issue of Monitoring Times from Grove Publications. They did a review of the new 9000 and compared it against the 2035 and 2006. You might be able to order a back copy of this issue from Grove at 1-800-438-8155. This is a great mag for new product reviews and general info concering scanning. I personally find too much SWL stuff in it but it's meant to cater to both audiences.

A past review of the 2035 in MT was favorable excpet for the Auto Store function which repeatedly stores the same frequency. This is the major reason why the 2035 is being discontinued and replaced by the 2042(?) which will have this "bug" removed. So I would assume that 2035 prices will drop once the new 2042 comes out.

I personally tend to prefer the RS line of scanners(whether GRE or Uniden made) and their features but find the 9000's Auto Store, alpha-numeric tags, and frequency hit counters very tempting...time will tell...

> I AM THINKING OF GETTING A FREQUENCY COUNTER FROM RADIO SHACK BUT WOULD
>Snip!!!

In response to your question above, How close you have to be depens upon the power output of the transmission under study, what the distance is between the transmission and the recieve point, the sensitivity of the counter and the gain factor of your intercept antenna.

If I were interested in finding new signals of interest or making a determination of what signals were being transmitted from an antenna site/farm. I would use a direction antenna with a beam patten of 3-6 degrees at most (yagi style) with a gain of at least 6 dB (cost should be less than $100.00). This would allow you to focus on the site of interest and eliminate a considerable amount of other signal sources.
A broad band preamp (+5-10 dB) would be of considerable value if one was attemping to intercept a directional signal when you are not located in the signal path.
The freq. counter used should be one that has an adjustable gain, adjustable gating period and will run off battery power (field use of course) as well as 110 VAC. You should be able to find one for less than $200.00 (opinion - RS is not the best place to be looking for something like that)

Hope this helps and info me on other peoples comments please.

Source record: 247347

Are there any other pager decoder programs available ? I have tried the Peter Baston program and it seems to work just fine on POCSAG but I need one for GOLAY. I built the 741 op-amp decoder and it works ok also. One of the problems with Peter's program is that it has to run in a dos environment and with win95, it's a pain. (Are you listening Peter?)

BTW, what hardware is everyone else using? The M400's are too expensive for me.

My guess is that you're talking about the '95 edition of Police Call,
and they might be running low on stock of those. There should
be a new one out for '96 before too much longer. (Probably in time
for the xmas selling season.)

Subject: Frequency CD-ROM - Where?

>> Does such an animal exist?

Call these fine folks:

PerCon Corporation
4906 Maple Springs / Ellery Road
Bemus Point, NY 14712
Phone (716) 386-6015 Fax (716) 386-6013

PerCon Corporation, the official contractor to the FCC, is the first to bring FCC Master Frequency data to CDROM. We provide a full line of FCC related databases for business and amateur markets in an ISO 9660 CDROM format that can be read by both PC and Macintosh compatible computers.

Data has been extracted from the FCC Master Frequency Database and is organized by individual regions or groups. Regional CDROMS are a geographic breakdown of the FCC's MFDB. There are five regions which cover the U.S. and each one contains an average of 700,000 records with 61 fields of information per record. The following is a list of CDROMS we have available:

Regional CDROMS Part Number Price
--- --- ---
NE Region - (ME,VT,NH,MA,RI,NY,DE,
CT,NJ,MD,DC,PA,OH,VA,WV) CDNE 99.95

SE Region - (WV,VA,KY,TN,NC,SC,MS,
AL,GA,FL) CDSE 99.95

NC Region - (MI,WI,MN,ND,SD,MT,WY,
NE,IA,IL,IN) CDNC 99.95

SC Region - (MO,KS,CO,NM,TX,OK,AR,LA)
CDSC 99.95

WE Region - (WA,OR,ID,CA,NV,UT,AZ,AK,HI)
CDWR 99.95

Regional Set- ALL 5 CDROMS CDRSET 450.00

Master Frequency-US Index-Dbase Format

Entire MFDB on a single CDROM. Consists of 11 fields with over 3 million frequency records from all 11 MFDB subsets. (See File Layout/Cross Reference Table for specific fields)

CDUS 79.95

Master Frequency-Frequency Sequence

Entire MFDB on a series of 7 CDROMS. Each CDROM contains entire US coverage for a specific frequency range. (See File Layout/ Cross Reference Table for specific fields. Same as regional format.) CDFSET *$1500.00
* First Time Purchase only. Additional purchases $750.00.

Data Access Program

The Data Access Program included with all of our software makes it possible to view and work with our data using a variety of functions. These functions include BROWSE, BOX and RADIUS SEARCH, QUERY, IMPORT and EXPORT, and REPORTS.

BROWSE - Allows the user to find data using 17 different search indexes with the regional CDROMS or 11 different search indexes when using the US CDROM.

BOX & RADIUS SEARCH - Using Lat & Long coordinates, data may be extracted for either a circular or box shaped geographic area.

QUERIES-Enables the user to extract data by using 15 preformated, fill in the blanks style queries.

IMPORT & EXPORT - Gives the user capability to import & export DBF & ASCII file formats to the system. Support is included to generate datafiles for many popular mapping programs. Support is also included for PROBE from Datafile, Scannerware from RCSI, and the HP-232.

REPORTS - This function allows the user to print reports using 20 different methods of selection. An exact range can be specified with each method. In addition, mailing labels can be produced using this function.

ADVANCED QUERY - The program also includes a query builder that allows the user to assemble a custom query using any of the fields provided.

Subject: Frequency CD-ROM - Where?

(Continued from previous message)

SPECTRUM:SPECTRUM is a nationwide frequency database with over 3 million records. It contains 15 fields of information including: Frequency, Callsign, Radio Service and Class of Station Codes, Transmitter City/ County/ State/ Lat& Long and number of units for Vehicles, Marine, Aircraft, Portables, and Pagers.

Spectrum has a simple to use program that has 7 fill in the blank style searches. Data can be displayed on the screen, printed to an 80 or 132 column report, or exported to a UFDBF file.

SPECTRUM: (WIN/DOS/MAC) 29.95

SPECTRUM for Scout: Spectrum for Scout is a special version of SPECTRUM designed specifically for use with OPTOELECTRONICS Scout. It has the same features and data content as SPECTRUM and the capabilty of reading in and processing data from a Scout datafile. A Scout datafile may be processed and compared with SPECTRUM data on either a city or countywide scale. Available through PerCon and OPTOELECTRONICS.

SPECTRUM for Scout: (WIN/DOS/MAC) 39.95

SPECTRUM Lite: SPECTRUM Lite is a special version of SPECTRUM with 2.8 million records designed specifically for retail. It has 6 different searches and the capability of displaying information to the screen or printing an 80 column report. It includes information such as: Frequency, Callsign, Radio Service and Class of Station Codes, Transmitter City/ County/ State, and number of units for Aircraft, Marine, Vehicle, Portables, and Pagers.

Ask your local Radio Shack dealer about availability. Sold only through reseller with a suggested retail price of $14.95. (WIN)

HAM_db : HAM_db is a nationwide Amateur Radio callsign database. It contains over 687,000 records and provides up to 43 fields of information per record. Some fields included

are: Callsign, Prev. Callsign, Name, Address, Lat & Long, DOB, Issue/Exp./Last Change Date, Callsign Group, FCC File No., Operating Class, and many more.

The program has 7 search functions including: Find records by Callsign, Prev. Callsign, or Name. Also, find all licenses in City, County, Zip Code, or by Lat & Long using a box search method. Data can be displayed to the screen, printed to a report or mailing label, or exported to a DBF or ASCII file.

HAM_db is sold in two forms:(WIN)

1. Through your local reseller with a suggested retail price of $14.95.

2. Through PerCon as a yearly subscription with 12 issues for $99.95. Price includes shipping and handling. Issues will be released approximately every 30 days.

HAM_db and Open Repeaters: HAM_db and Open Repeaters has all of the same capabilities and features as HAM_db plus a database of over 10,000 open repeaters across the U.S. Fields for the repeaters include : Frequency, Offset, Auto Patch, PL Tone, Repeater City/ County/ State/ Geo-coded Lat & Long. The repeaters may be searched by Frequency, City, County, or State.

HAM_db and Open Repeaters (WIN/DOS/MAC) 29.95

Coming Soon From PerCon:

PAMS_db: An aeronautical database comprised of many databases. It features information such as: Pilots Licenses, Mechanics, Aircraft Registration, and Service Difficulty Reports.

Aeronautical Frequency Directory: An aeronautical frequency directory for the entire U.S.

For more information on current and upcoming products call PerCon at (716)386-6015.

Prices shown do not include shipping & handling or sales tax *. Please add $7.50** per order +$2.00 for each additional CDROM. Full sets require a $15.00 S&H charge. All items shipped UPS BLUE (except PO BOXES). UPS Red and FedEx available for an additional cost to be determined by weight and destination of product.

JA>* In a message originally to ROBERT-S@IX.NETCOM.COM

JA>To: robert-s@ix.netcom.com
JA>Subject: CHP Reception

JA>>In Sacramento California the CHP just brought on line some new kind of
JA>>radio system in the UHF range. There are three towers with a microwave

JA>I live in Sonoma County, CA and have been listening to the CHP for
ars.

JA>For the last month or so I've been hearing "Golden Gate" (42.880 Sonoma
JA>County Orange) on 453.825, loud and clear all over the county and now
JA>it's gone.

JA>At one point I heard a mobile unit trying to talk simplex with Golden
JA>Gate and the mobile referred to "high band" like this, "golden
JA>gate.......ten victor eleven.............golden gate ten victor eleven
JA>on high band........."

JA>I never actually heard Golden Gate reply.

JA>jim

JA> * OLX 1.52 * james.lepphaille@1:2002/150 - Forestville, CA ,USA

acutally, what you're hearing is what the state recently did for the
state police (yes, CA >does< have state police!). i believe they got
rid of some of the old state police dispatching facilities in the bay
area and now dispatch the state police officers near the waterfront
areas through the golden gate chp setup. 453.825 is linked, (now at low
power, which is why the great reception you were hearing is gone!),
through a low power repeater near the waterfront areas and customs
offices and vicinity in san francisco. you can still monitor all the
traffic on 453.825 if you're up in the city. i'm not sure what all the
reasoning behind all this was, but this is what has been happening...

>weenies to figure out how to make keys). Oh yeah try the Visible Light
>Spectrum!:-) The Navy uses flashing light and flags quite a bit!

I just left the company that was contracted to do the installs on the
Navy and Coast Guard ships for the 400 mhz hand held / repeater
systems. These hand helds are used primarily during tactitcal evals
and training. I was told that the purpose for their installation was
that the bridge and other parts of the ship would be able to
communicate in the event of an attack.Since hard wire systems are
usually the first things to stop working after getting hit. They are
made by Motorola and are fairly chintze (Cheap Construction). Drop one
from waist high and their near history. I don't remember the exact
frequencies they were on since they are not marked (ON PURPOSE), but
was told that they are in the 400 Mhz range. Antenna fairly confirms
the story told. Most of the installations our company did were on
Coast Guard vessels, but their were several Navy vessels as well. I
had the opportunity to test one while they were in the shop prior to
assembly. Audio and squelch had the normal Motorola characteristics.
They seemed a little bothered by florecent lighting and the range was
fairly limited. You would have to be fairly close to hear a hand held
off repeater. The radios had four available channels accessed by a
switch located on top of the radio, as well as squelch and volume
controls. Normal Motorola grey and black features with their name on
it.

The cable used was very stiff and highly shielded. The cable appeared
to be about 1 inch in dia. and grey in color. THIS cable was the coax.

These installations occured at New Groton, Norfolk, and San Diego and someplace in Washington or Oregon (Seattle rings a bell). These installations took place in November 1994 - June 1995. In all, our company did about 22 ships during this time frame. It took a crew of 4 guys about 4-5 days to complete the installation. We had several crews doing these installations in partnership with another company (whose name I do not remember). This was a subcontract for the Motorola company though.

The repeaters were mounted in stainless steel cases about 3 foot by 2 foot by 1-1/2" foot. The cases were mounted to a bulk-head and not intended to be painted. Each had mounting pads for radio repeater unit , batteries, charger, hinged front face panel with power LEDs and toggle switches. Key locked. A rubber flexible antenna was mounted to the top of the unit. External power and antenna ports are also used.

Since I was the computer database manager my access to the areas, was a little limited and information gathered was at some effort.

Anyway, you seadogs may want to check out 400 in your areas. More especially in the ones mentioned.

>to relax. Just my 2 cents worth.

And a valid viewpoint.
However (it seems that there's *always* a "however", doesn't it??), not only are the radios we use becoming more computerized themselves, but more and more of them are becoming able to be interfaced with computers, as well. This ability means that, as software becomes available, the radio can do much more than its designers ever thought it could. This can only enhance our listening.
The core is, of course, the computer we use to do the interfacing. As software becomes more demanding of the hardware, we have to keep improving the hardware to match the capabilities of the software. And *that's* the connection.
Of course, to you, who deals with computers all day, this sort of column may seem a little too much, but there are an awful lot of people out there with older computers they've never upgraded (or bought at a yard sale), and this sort of info may be just what's needed to help those people start that upgrade.
Anyway, that's how *I* see it.
Bill

1003. FS: FRG-9600 w/extras- Mint

FOR SALE: AOR AR-2500 scanner.
2016 channels (1984 scan, 32 search pairs)
0.5 - 1500 MHz full coverage (including SW and cellular)
User-selectable AM, NFM, and WFM
BFO for SSB reception
Signal strength LED bar-graph (9 or 10 segments, I forget)
Built-in 9-pin RS-232 port
Attenuator switch to reduce intermod
Back panel doo-dads: atten switch, BNC ant jack, ext spkr, RS-232, & power
Includes power supply and RS-232 cable
Compact and light weight
Very good/excellent condition (no LCD backlight; very light cup ring
mark on top; otherwise perfect--will
guarantee)

If interested, please contact me by email or phone to work out a price,
or possible trade for good hand-held. I will give you more details, including
my honest opinion of this rig's good and bad points.

1007. Help - Bearcat 890XLT info needed

Newsgroup: rec.radio.scanner
Date: 1995-10-26 00:00:00 UTC
From: phpyoung@acs.eku.edu
Message-ID: <1995Oct26.120739.6775@acs.eku.edu>
Source record: 247284

I need information on the Bearcat 890 XLT. I am looking for
keyboard control hacks, specifically one that will disable AUTO-SORT
(No, I don't mean Auto-Scan), and any known method of clearing any single
BANK of freqs (other than Uniden's method of 60 key-presses). This is a
new model, so no, I do not care about "cellular" mods, as I have enough
trouble avoiding criminal activity by dodging those pesky cell images
21.6 MHz above the cell band anyway. But does anyone know of a mod
to get access to unused CTCSS tone frequency storage RAM?? It would seem
the 890 provides a RAM location for every channel, and if you don't use a CTCSS
board it is wasted! HELP!!

Much thanx...

the wildman

Whoa there! You're talking Air Force usage! Everyone knows the Air Force spends tons of money on fancy stuff. Not so in the Navy. There is no ship wired for a trunked system, heck, we don't have that much traffic. Almost all ships (at least the ones I've been on) use VHF low band (~39Mhz). Ships have WIFCOM (WIreless Firefighting COMmunication) systems installed and the ship usually has leaky coax wired in so everyone can talk to everyone around the ship. Theres also a "mutual aid" channel in case another ship catches fire and other ships get involved. Things may be changing, but, a trunked system is simply not needed on a ship. You're range picking up a Navy ship will be very limited since the systems usually never have a repeater, some ships wire an external antenna up to the yardarm so they can talk to Pier watches etc. Traffic probably won't be too interesting either. "OOD this is Pier Watch reporting all conditions normal" "This is the OOD roger out."

I've been seeing stuff about these CTCSS boards some scanners have. Do
the things really cut down on interefernce. Are they useful for anything.
Will they give you a display of a channels CTCSS tone if you don't know
it? I don't have the cash to buy a scanner with one but I'd like to see if
these things are any good.

Silas E. Cheeseman (nbschee@nbnet.nb.ca) wrote:
> Is there a modification for a PRO-51 to receive the 800MHz band?

The Pro-51 receives the 800 MHz band straight out of box. For most
people, the 800 MHz band is 806-823 MHz and 851-869 MHz.

Much of the cellular phone band, 869-896 MHz, if that is what you want,
can be received as images (in the frequency range 21.4 MHz higher).

>: in a few minutes, then go back to whatever I was doing on the computer
>: while listening to the scanner.

>Well, with the Opto unit there is no waiting to reprogramme at all.

Certainly. I didn't say you had to. I just said you HAVE to have the
computer running the software in order to enjoy those frequencies you
reprogrammed. It does me no good when I want to use my computer for
something else. That is the point I was making.

> However, the
>PRO-2006 doesn't "go mobile" very well anyway (there's no mounting
>bracket and it's kinda big) and I know of nobody who uses one in their
>vehicle.

No, but I do take my PRO-34 in my car, and I can program it with the
CE-232. Can the OPTO program my PRO-34? Or anyother mobile scanner?
Also, the going mobile is not the only reason to reprogram the
scanner. BTW, a mounting bracket WAS made for the 2006...

>With the Opto you really don't need the CE-232 and that is my point.

You are wrong. I cannot dedicate my computer to the OPTO software.
So, I DO need a method to autoprogram the 2006 to be able to listen to
those newfound frequencies without tying up the computer. If I just
had the OTPO, that would not be possible, would it?

>The experiences that I've had with Bill Cheek have not been favourable
>either and I would not encourage anyone to deal with him.

Well, your experience with Bill Cheek, is merely anecdotal, as is
mine. I offer mine to counter yours. He was above board completely
when selling me the CE-232.

>You decide! 8-D

I did!

I recently purchase some 900 ma nicads at a Ham show. The question I have is that the person sold me a charger which is a 100 ma. He said to charge them for about 10 hours. It seems like I should be using a higher capacity charger in order to get the full charge for these batteries. Any comments or suggestions?

In the 1995 Gene Hughes Police Call (Blue cover) there are a few nice pages on the state microwave and UHF layout. I would also tend to agree with one of the other posts. CHP, CSP are now one. Therefore sharing radio resources. I think it would be nice to have CHP on UHF.

I live at Edwards AFB, and find that during the summer CHP signals tend to skip over us. :-). It would be nice to have solid desert coverage of CHP.

Blake, at 100+wpm typing this stuff in is truly a joy for me. 8-D

: Stupid actually. I mean, come on Andy. Let it go! You hate Bill,
: that is evident, but you just persist, with such garbage!

Well, I will cut back on this as I think that I have made my point now.

If Cheek wasn't so keen on jabbing me one last time every time I would be
more inclined to shut my big mouth! 8-D He's the one that just has to
keep the fires burning.

: And you know that is all there is, just your pathtic whinings,
: even in your E-Mail to me, where you talk about how you hate him, and
: are "Out to get him". (If you forgot that, let me know, and I can post
: it back to you. I saved it)

Yes, I remember that vividly. But check the message again because I
think you missed the point of that letter - not to mention I've never
used the term "out to get him" EVER. I think I used the term "Cheek is his
own worst enemy - and I'm his second! <G> " or something to that effect.

: BTW, if they let you back on the FIDO, you would see where a gentleman
: in MN is doing some experiments with TV antennas for scanners, and has
: found so far that they do exhibit gain, much like the ones I used to use,
: before having free access to commercial antennas.

Blake, I'm an engineer with my company and our core business is antennas,
filters, combiners, isolators, etc. etc. To me, the educational value of
some hobbyist hacking TV antennas and posting unrepeatable "proofs" on a
freebie BBS with no referenced gain claims is nil.

Another thing Blake, I was not "kicked off of Fido" in any way - this is
something that Cheek and the rest of his cronies find hard to accept.
I don't post there any more - but am one of the silent majority, if you will.
Fido's a freebie network that has frugal, non-paying hobbyists as it's
members and backbone. It is rapidly becoming a less-used secondary road
to the "infobahn". It's hardly worthy of my time and I wonder why
Cheek even bothers with it. Well, actually I think I know why but
I won't get into that.

Remarkably, the best Cheek and his bunch can do here is attempt to
dissect my personality. I posted a review of Cheek's WSR ripoff newsletter and

NOBODY challenged ANY of the MANY points I made. The fact of the matter was that it was all TRUE and there is little if anything Cheek could say. The subscribers have the damn thing in their hands as the evidence. As outrageous as some of the things I said were, I didn't make this stuff up! Cheek was so worried I was going to post it on Fido (which I had never planned too) he got the sysop at this end all worried with threats of cut feeds and corrective actions etc! He's all Mr. Cool in the public areas but takes on a markedly different personality in private conversation! 8-D

: But let it go! It is pathetic at this point.

Well, Cheek and others just can't seem to leave my name alone over on Fido even though i've made no comments in months. It would appear that the problem with dropping the whole thing is with Cheek and not me.

I'm willing to put a cork in it for the next little while - and hopefully longer.

Cheers!

Andy

1046. Trunked Radio systems and the law

Newsgroup: rec.radio.scanner
Date: 1995-10-26 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <DH18qH.32@ennews.eas.asu.edu>
Source record: 247373

Was anyone really surprised when they read Jorge Rodriguez's article on the November issue of Monitoring Times about the laws relating to trunked radio systems? To summarize, there is a case the was recently decided (the Larry Gass case) which essentially stated that listening to a trunked radio system is illegal, period. Even just listening with a regular scanner. Since the case is on appeal now, I don't know what the "official" status of the case law is, but I am sure someone out there knows better than I do.

The case may be overturned on appeal, but I'm not holding my breath. Is it any surprise that trunked radio systems would be the next casualty of the ECPA? Next it will probably be illegal to listen to any public safety communications. After that, I can only assume that our laws will be similar to those of Britain..."Broadcast and amateur monitoring only".

Has anyone else read this article? Any thoughts to add? Am I blowing this out of proportion?

I have been looking for another time/date stamp vox operated tape
recorder for camping out on frequencies that get used infrequently.
I currently have a Sony microcassette model that works great, but they
discontinued these and I can't get these compact little gems anymore.
Radio Shack has just come out with their version of this same micro
cassette recorder for a little more than $100.
I intend to buy one and compare it against the Sony model I own.
Great devices for unattended monitoring and later play-back of the
commujnications.

I agree, the majority of scanning equipment that I own is RS. I have
always found them to be the best quality most reliable scanners.

I also own 3 Bearcats (760XLT, 220XLT, and 9000XLT). They are good scanners, however I still prefer the RS units.

Of course the major drawback to RS scanners is now their price ($450 for the PRO-2042).

Maybe if enough of us wait to by new scanners RS will drop their price back to where it used to be!

Source record: 247379

I don't know what the US Navy is doing, but the USAF is moving most of its communication to the band between 406 and 420 MHz. The system here at Wright Patterson is a multi-channel trunked system with everyone on (security, fire, civil engineers, maintenance, etc.) sharing the channels (just like 800MHz systems). I'd search through the 406-410 range first. Only reason I recommend in that range is I recall reading a table of AF usage (for the new trunkes systems) and they were almost all below 410.

Good Luck and let us know what you find.

Lynn Hales

Voice ops? No time soon I would imagine. Their voice ops have just received a (pricey & technically sophisticated) overhaul in the UHF and UHF-T bands.
They are though, migrating to Digital from their current Analog propogation.

FYI: Please do know that -some- Los Angeles City departments do operate in the 800 MHz band.

For example: the Los Angeles FIRE Department (LAFD) does have its voice ops on 800 MHz analog & non-trunked. You can receive a complete list of those frequencies by visiting the LAFD's Web site at:

http://www.ci.la.ca.us/department/LAFD/index.html

> is that (LAPD)
>going to be a trunked system?

If you see LAPD on 800 MHz in the forseeable future, I imagine it would be data as opposed to voice.....(then again anything is possible). Most 800 Mhz plans require trunking, but there are many variables.

If you monitor LAPD radio traffic, you are likely close enough to attend a Police public exhibition or Neighborhood Watch meeting. Contrary to speculation, most LAPD Officers enjoy explaining and demonstrating their communications system to the public. What better place to learn about how LAPD communicates than in the front seat of a patrol car?

You can always write to our friends at the Los Angeles Police Department c/o their Headquarters.

The TV antennae will work surprisingly well. Try this: point the antennae toward the mountain You may end up with better results by receiving the reflections from the mountain which is much higher than anything you could stick up in the air. For me, this is the only method of receiving television, or much of anything.

In article <46pn4j$ogu@data.interserv.net>, mkylxit@centcon.com writes:
> I was told that you can use a exterior T.V antenna as a great antenna for specific freq. on a scanner.

The info in the front of the book is useful to everyone, newcomers and old timers alike. I'm not going to even debate that point. That's not the reason people buy PC, however. It's main usefulness is ostensibly as a guide to frequencies. I guess I should not have assumed that everyone recognizes this obvious fact and stated it more explicitly.

> I read Police Call's section on trunked systems. Keep in mind that at the
> time I know NOTHING, zero, and zilch about trunked systems other than
> there is a radio concept called 'trunked.' Literally, (after I had
> programmed the frequencies according to advice in the book) in 20

>them for about 10 hours. It seems like I should be using a higher capacity
>charger in order to get the full charge for these batteries. Any comments
>or suggestions?

The rule of thumb is C/10 for 14 hours.

In other words, for 900mAH NiCd cells you would charge at 90mA for 14 hours.

Another way of looking at the rule of thumb is that you should overcharge by 40%. Hence the rule above of charging at one tenth of capacity but for 14 hours.

At that rate (C/10) it is considered quite safe to moderately overcharge cells and they shouldn't come to any harm if accidentally left on charge for, say, 24 hours.

There are LOADS of "theories" about charging NiCd (and other) cells, most of them based on hearsay and superstition.

The truth of the matter is that until the cell reaches a fully charged state, it will be using whatever current you feed it to carry out the relevant chemical changes that constitute charging.

The moment the cell has fully charged - that is to say the chemical change is complete - any current you feed it will be converted into heat and will begin to heat the cell from the inside out.

If the charge current under these conditions is low enough (C/10 or less) the cell is generally able to dissipate this heat to the outside world as fast as it is generated and so the cell survives.

When you are rapid charging - say at C/1 which would be a charge current of 900mA for your cells - then, once the cells have fully charged, the rate of heat generation is far higher than the rate of heat dissipation seeing as the cells were never made as heatsinking devices capable of dissipating heat effectively.

The core of the call overheats, becomes permanently damaged and the cell may very well explode.

There are finer details to all of this such as memory effect etc but I won't go into that here - it's been discussed to death.

So, basically, if the charger you were given is going to deliver a constant 100mA to your cells then it's just about perfect for the job.

From: scotte@ccs.neu.edu
Message-ID: <46ro9e$6v7@camelot.ccs.neu.edu>
Source record: 247138
Cross-posted to: ne.forsale,rec.radio.scanner

I have an ICOM IC-3SAT 220 Mhz handheld transceiver (HT) in excellent condition.

What you get:

ICOM IC-3SAT HT, 220 - 225 Mhz transmit and receive with PL board installed

BC-80 Desktop Charger

BA-12 Charge Adapter

Manual

The radio hasn't been used much, and most of that usage was indoors.

I am asking $250, but will negotiate. Ham Radio stores sell it for around $330.

The 3SAT is an Amateur Radio Transceiver. You must have a valid Technician Class Amateur License to transmit with the radio.

You do not need a license if you wish to use it as a scanner.

1062. T.V Antenna??????

Newsgroup: rec.radio.scanner
Date: 1995-10-27 00:00:00 UTC
From: mkylxit@centcon.com
Message-ID: <46pn4j$ogu@data.interserv.net>
Source record: 247139

I was told that you can use a exterior T.V antenna as a great antenna for specific freq. on a scanner.
I leave in an area that is about 12-20 miles outside all the good stuff. My house is up against a mountain
and the signal to those great freqs is weak. I bought a R.S Discone and a little 20 db. preamp which together
works pretty well. But I want better. The main freq range that I like to listen to is 506-507 mhz. I am not a load to put an
antenna out side, but can mount one in the attic. Will a T.V. antenna work good, considering I can point it in the right direction?
And what about the ohms? Most T.V antennas are setup for 75 ohms, where my scanner is 50 ohms. Please Help!!!!!!!!!!!!!!!

>all ships (at least the ones I've been on) use VHF low band (~39Mhz).

Whoa there! I suggest you get aboard more USN ships, particularly the
CVNs, because they're phasing in these new systems (406-420MHz) which if
I recall right, are using GE/Ericsson EDACS-type gear (i.e. trunking!).

There was an article about it recently in one of the military comms
professional journals, & I'll try to dig it up so I can give some
particulars.

I suppose the practicality of this system lies mostly with the cities
of Eisenhower, George Washington, Theodore Roosevelt, etc. but in a
wartime situation where a DD, FFG, etc. has sustained some bulkhead
damage, many of the priority wire-based intercom circuits could be down,
whereas the EDACS system they're using has some redundancy designed into
their system.

It should charge them in 12.6 hours.

Charging nicads from dead requires about 1.4C

For a 900 mAH cell that's 1260 mAH.

A 100 mA charger will provide that in 12.6 hours.

Hey Bill,
I just received The Ultimate Scanner Mod book #3 and am preparing
to apply some of this new found knowledge to my PRO-2006. I am
interested in knowing if there are any major mod's for the 2006 in your
earlier books.
Also, I would like ordering information on you CE-232K1 Interface
kit, like how much it costs and do I order it from you?
And does the above kit come with the software too?

I am getting ready to make the memory mod to the scanner and have sent a
letter to Mark Peirsson requesting information on the LINKALL. I figure
that would be more convenient than moving DIP switcches.

Thank you for all the wonderful information that you have
compiled in your new book. Looking foward to hearing from you!

The MVT 8000 is a brilliantly designed angled front panel, 200 channel ac/dc scanner. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on my desk.

It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners. Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:
Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)
Of course, you can change factory settings. It also has a battery save function.

1085. Intermodulation

Newsgroup: rec.radio.scanner
Date: 1995-10-27 00:00:00 UTC
From: plplants@telerama.lm.com
Message-ID: <46pm8g$kdd@india.lm.com>
Source record: 247319

I live near Pittsburgh, Pa. and the intermodulation is so bad that using a scanner is almost impossible. I live very high on a hill and use an outside Antenna Specialists antenna. I can see for about 15 miles from my roof.

I have Uniden Bearcat BC580xlt and BC100xlt both have better sensitivity then the Regencys. But the intermod makes using the Bearcats impossible.

I also have Regency K500 and M400 both old but still work good. The intermod is not as bad as the Unidens but the sensitivity is not as good.

Can someone advise of a scanner that doesn't have the intermod problems of the above scanners or a fix for the problems.

Please respond by e-mail as my Internet site is having problems with newsgroups.

There are several organizations that publish racing frequencies on a monthly basis. The one I belong to is Frequency Fan Club P.O. Box 1987 Richmond Hill, GA 31324 1-800-RACE FAN. The cost for new subscriptions is $30.00 for 12 monthly issues of $55.00 for 24 monthly issues. A renewal for members is $5.00 under the new rate each year. Hope this helps.

> or suggestions?

The standard NiCad charge rate is 10% of capacity, so your 100 ma charger
is about right. Leave them in for around 10 - 12 hours for a full charge.
Most NiCad cells will tolerate a higher charge rate, but can be damaged by
heat buildup if you overcharge.

Andrew,
Ahh very good answer but not all CABLE firms do the same programming
Here in the Kansas City Metro area one cable company that does
the shuttle video is a smaller firm that only covers part of kansas.. the
other larger ones do not carry nasa select at all....

The video is retransmitted on the ham video repeater which can be seen in
most of the metro areea but this takes a outside antenna and some other work
to receive this WEAK signal..

1091. AOR8000 Wandering Birdie

Newsgroup: rec.radio.scanner
Date: 1995-10-27 00:00:00 UTC
From: fkelcz@facstaff.wisc.edu
Message-ID: <fkelcz.102.00DC0303@facstaff.wisc.edu>
Source record: 247325

I purchased an AOR8000 and am overall quite happy with it. However, I have encountered what EEB, the seller, describes as the "wandering birdie".

My scanner stops at one of three freqs 460.575, 460.600 or 460.625 although no transmission is occuring on the channel. Unlike the typical birdie, disconnecting the whip antenna eliminates the birdie. If fact, simply touching the base of the antenna, I can "modulate" the signal strength of this pseudobirdie from 5 bars (not touching) to 3 bars (two fingers) to elimination (wrapping hand about base of whip), while NOT affecting signal strength of valid signals.

Just was curious how many other AR8000 users out there have had this problem.

LAPD is going digital, so you won't be able to listen to there transmissions. The transition will take about 2 years, so some of the old frequencies will still be in use until then.

Can anyone please provide some tech info on the Tulsa system.
Was it a SmartNet or PrivacyPlus system?
Was the PD using type I, type II, or type IIi format fleets.

If they were type II only, how was Mr. Gass able to make the Standard
radios operate when the manufacturer says the are capable of type I only.

What type of s/w did Mr. Gass use on the Standard radios. Did he modify
the Standard factory s/w, or was he somehow able to use the STX LAB s/w
on the Standard radios.

Anyother info on the system he hacked would be appreciated.

I seem to have heard some rumor too about that, but I'm really unsure. I know the LAPD now uses some digital units for communications that they want more secure (like drug surveilance). But if they go to 800 mhz, or totally digital, I think it might be quite a while. The reason I think so, is I assume you live in the L.A. area. Obviously you know L.A. County and L.A. City are broke. They have not much money at all to even patch the streets, keep public hospitals or libraries open, or buy new police cars. The LAPD has quite a fleet of old, rusted-out, police cars, as you might see. With all these problems, where are they going to get the money to install fancy new radios on every police car and motorcycle, let alone new portable units and base stations? We're talking maybe $50 millions dollars worth of stuff for a police department the size of the LAPD. So I think we still have many years of happy scanning left of the LAPD in the frequency ranges they're using now.

Hello;

I haven't seen the MT article, but there was a piece in the U.S. Scanner News, regarding the same topic. The first thing that comes to my mind is, wait a minute; I'm paying taxes to support my local municipality, and they use some of the "contributions", to upgrade to a trunked system, that I no longer have a right to monitor? I feel scanner monitors provide a check and balance system, with our local law enforcement.

Hello;

To put it very simply; If you really want to know what goes on in the area in which you live, purchase a scanner. If you wish to remain a member of the GDP, or generally dumb public, continue to watch your local news, and read your local paper. Ninety percent of the action I hear on my scanner is not reported in either media outlet. It's almost like they don't want you to know what's happening. Naah! Couldn't be.

The MVT 8000 description is a brilliantly designed angled front panel, 200 channel ac/dc scanner. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on my desk.

It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.

Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:

Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)

Of course, you can change factory settings. It also has a battery save function.

$650.00
plus shipping --

I use a RS UHF corner reflector antenna to monitor LAPD (506-508Mhz). I am about 75 miles from the center of LA. The antenna is mounted on an old rotor I bought at a Ham swap meet. I also use the RS preamp on this antenna and a discone. I modified the UHF antenna to vertical polarization and added window screen to the reflector elements to increase the signal (this is a trick from a ham friend). Steve in Escondido, CA

I could not egree more. The older media here is finally going to get some competition, BUT, for the moment, it looks like if there isn't a lot of flash, blood, and/or gore, they don't care. Of course that doesn't keep them from covering anything that fits their political agenda.

Case in point::: earlier this year, we had a fire at a custom manufacturer where CYANIDE was used in Durham. Did the media cover this potential Bhopal? Nope! AND on top of that, and cyanide laced smoke probably would havee over the Research Triangle Park.

So scan, the life you save may be your own!!

You know, I've heard people propose this "check and
balance" idea with respect to hobby monitoring of the
police before. I'm all for scanning. In fact, my side
business depends on the free exercise of the hobby for its
survival. But I don't see how scanner hobbyists do
anything to keep local government in check.

I would be very interested in examples of ways in which
scanner monitors have actually participated in the
governance process based on their interceptions of radio
traffic. When, for example, has a scanner listener ever
blown the whistle on police misconduct?

What is the scannist's role in local government? If we
have one, I for one would be happy to both exercise the
right/privilege and publicize the issue as widely as
possible.

I'm looking for the same thing... except that I want something that could work
a sound card as an input instead of the RS232 or enven use the modem.

So. If anyone as a software that can decode pagers with the sound card's
input please send it to me or tell me where I can find it.

Thanks.

Let's try that again in plain text . . .

Here's the mod, but if you bought your scanner after September 1994 it probably won't work.

==========

Radio Shack PRO-51 Test Modes

Howard Bornstein
June 2, 1994.
[This document may be freely distributed for all non-commercial purposes.]

There is an interesting test mode in the PRO-51 that, combined with the direct search feature of the scanner, lets you pick up out-of-band frequencies. You will have full access to the 66-88 Mhz ranges as well as the cellular base range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of these comments should be true for any Uniden-made Radio Shack scanner, such as the PRO-46). I'll describe them first and then how to take advantage of one of them to get the restricted frequencies.

There are three data test modes. These modes completely destroy any frequencies you had programmed into your scanner, so it's best to use these techniques before you program your scanner. If you have already programmed it, you'll have to decide if these new capabilities are worth reprogramming.

TEST MODE 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is to hold down the 2 key, the 9 key, and turn on the scanner. All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the
scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500
11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage. More on
how to use these in a minute.

TEST MODE 2. Fill channels 1-17 with test frequencies.

Press 2, 9, Manual

Fills channels 1-17 with these frequencies:

30.00, 40.00, 50.00, 140.00, 155.00, 170.00, 410.00, 460.00,
510.00, 54.00,
109.00, 118.00, 127.00, 135.00, 810.00, 860.00, 950.00.

There is also a display diagnotic mode.

TEST MODE 3. Display Test.

Press 2, 9, BAND or 2, 9, MONI.

This put the display in test mode. Every annunciator and
every digit element is turned on in a scan from the left side

of the display to the right. To keep this test mode continuous, release the buttons before the first scan finishes. This mode does not affect stored memory. Press any key to exit this display mode.

Now, if you've decided to try test mode 1, you will find several out-of-band frequencies stored in your memory channels. Channels 14-16 hold frequencies in the blocked-out 66-88 Mhz range, and channel 23 holds a frequency in the blocked-out cellular base range. Once you have these frequencies stored in a memory channel, the PRO-51's direct search feature will let you search though these ranges. In the cellular band, the scanner searches in the correct 30 Khz steps.

You don't have to keep these frequencies in the channels they were stored by the test mode. You can move them to any channel in the scanner. HereUs how.

First move the frequency to a monitor channel:

While on a channel with one of these frequencies, open squelch completely. Press direct search button, either up or down. The direct search button puts the scanner into search mode and the open squelch holds the frequency. Then press the Monitor button. The frequency is now in the monitor channel indicated in the display.

Now you can move it to any regular memory channel in the scanner:

Enter the channel number
Press PROG
Press MONI
Press the number of the monitor channel if the proper channel is not displayed
Press E(nter)

The frequency is now permanently stored in the memory channel. You can do a direct search from this memory channel at any time.

The 66-88 Mhz range mainly covers TV audio. However, there is a strange phenomenon concerning TV audio and the PRO-51. Channels 4, 5, and 6 fall within the 66-88 Mhz range (71.75 Mhz, 81.75 Mhz, and 87.75 Mhz respectively), yet the PRO-51 will not pick up the audio frequency while searching in this range. However, TV channel 2 audio is at 59.75 Mhz. When you add the intermediate frequency of 21.6 Mhz, you get an image of the TV channel 2 audio appearing at 81.35 Mhz. This does come in, although raspy, since the PRO-51 is receiving in narrow FM mode while TV audio requires wide-band FM mode for proper reception.

I'd be interested if anyone can verify that any of these test modes work on the PRO-46 or any other Uniden-made Radio Shack scanner.

From: rallen8184@aol.com
Message-ID: <46ufdo$e5a@newsbf02.news.aol.com>
Source record: 247233

Hello;

I'm listening to a BC700a at the moment, and I picked it up because the local K-fart was closing them out at 79 bucks a pop. I bought two. These usually retail for about 190 bucks, and I wouldn't pay that much. It has nice audio, and 800mhz capability, but in all actuality, this is not a scanner I would recommend buying at that price. Why? The 700a is basically a pre-programmed unit, for lazy people who don't want to invest the time to program their scanner. There are 50 channels you can program, but they are not in the same frequency banks. There is also no direct entry available on this scanner, and that really sucks. You should buy a direct entry fully programable scanner, with as many channels as you can afford. I'd say no less than a hundred. That seems like alot, but believe me, if you get into scanning at all, you'll need them.

You might post as to what you will use your scanner, for? Is it for your vehicle, or your home? For instance, a BC 860xlt base unit is only 149.00, yet has 100 programable channels, and 800mhz. It all depends on what bells and whistles you want, and how much you are willing to spend. Do you want a reliable Chevrolet, or a top of the line, tricked out Cadillac. Hope this helps, and not confuses you.

Rich

If removing the antenna removes the "birdie", then it wasn't a birdie at all. Birdies are generated internally by the radio in use; they don't enter via the antenna.
Wanna see something really interesting about birdies??
On my R-7100, I have a Grove SPU spectrum analyzer connected. As the radio searches, I will see birdies as they actually move through the spectrum, some of them in the opposite direction to the search! The radio very seldom locks on one, though.

Folks,

Thanks much for your input. I leave for Hong Kong soon and don't expect great deals. I've secured an Amateur Electronic Supply catalog and will shop cautiously. I didn't even consider the warranty issue and I'm much obliged to have had it brought to my attention.

I am surprised that nobody really seemed to mention the possibilities and benefits of expanded frequencies. Perhaps you're all old timers who've gotten the modifiable radios (like my friends), or you don't really care to listen in on the verboten bands. Regardless, I'll have an HT on returning from HK or I'll get one here soon thereafter (likely the latter).

I might have mentioned that I have been to HK once before, so I know generally what to expect. I'll have a few more sharp suits and memories of the stunning views.

Thanks,
Mike

1131. Re: LAPD Switching to 800mhz?

Newsgroup: rec.radio.scanner
Date: 1995-10-29 00:00:00 UTC
From: Brian Chrisman <Ericr@earthlink.net>
Message-ID: <46uhhv$ljs@mars.earthlink.net>
Source record: 247238

At this time I don't believe that LAPD is going to 800mhz, radio system because they just spent a fortune on new Motorola Astro packsets. LAPD does have new licenses for 480 mhz. frequencies. Most of the new radios have approxamently 150 to 180 freqs programmed into the radios. The Sabers are wide band radios so they are still using the older 506 mhz, freqs and the newer 480 mhz. freqs. The only bummer is the radios have digital encryption capability so listening to the LAPD won't be as easy. The good thing is LAPD now has the capability to communicate to its surrounding agencies and LA Sheriff's on their new radios. As far as I can see though is they still have the old radios in their radio cars. The Southern California Police Call freq. book has a informative article about the radios.

Hi David:

The scannist's role in local public safety is to provide an extra pair of eyes and ears. He or she should report fires, suspicious activities, pursue DUIs, ect. Law Enforecement should realize what potential benefits there is in having an aware and listening public, and should take advantage of it.

Comments, especially from Public Safety folks?

That really sounds terrible to me, but don't put all your eggs in one basket. What I'm really trying to say is don't put too much faith in the words of a RS salesman. I've depended on them before and been greatly deceived. Through ignorance if not malice. Even if the police call books aren't carried by them anymore, you can probably find a local BBS that is dedicated to amateur radio, ham, and scanners. I have several here in Dallas that list about 50,000 freq's including private security, malls, schools, airports, racing, hotels, and much more. So before giving up - check your local BBS's. Happy hunting!

1137. BC200XLT Operation Help Needed

Newsgroup: rec.radio.scanner
Date: 1995-10-29 00:00:00 UTC
From: cu2@ix.netcom.com
Message-ID: <46vp3i$9t8@ixnews4.ix.netcom.com>
Source record: 247244

I just purchased a 200XLT from a pawn dealer and he did not have the manual for it. I sure would like to find some help working the scanner.

..would really appreciate some scans of the manual or some instruction on how to work the keypad. I have figured out VERY basic input procedures but not much luck the 'search' button. :-)

A frequency range table would also be nice -- essentially anything your average techno gadget freak like me would be interested in.

Thanks!

cu2@ix.netcom.com

L> Here's the facts and listen up so we can kill this thread!:

[....Snip Happens....]

Since there are so many experts here in the r.r.s newsgroup that understand cellular operations, I want to post a request.

My company is thinking of developing a data logging device that incorporates cellular operation for data retrieval. This would eliminate the need for a dedicated phone and adapter, making the device more modular and compact.

Right now I'm in the preliminary stages of presenting the idea to the powers that be. My question is: Does anyone know where I can get a basic schematic of a generic cell phone, including IC's that are common to all phones. Note, I'm not really interested in brand X or Y, since that would probably be a copyright infringement. I just want to get a better understanding of how the device works internally.

If anyone knows of a more appropriate newsgroup, I'll send my question there as well.

Flame Away....

Derek (who probably owns the only non-modified modifiable PRO-43 in the world)

Message-ID: <46vap3$j6m@bingnet1.cc.binghamton.edu>
Source record: 247248

Jesus christ none of you are correct!!!!
As for the last post, there are no "mobile-to-mobile" calls eg: the phone does not transmit directly to the other cell phone. It must go through a cell site, then retransmitted from a cell site to the other cell phone.

Here's the facts and listen up so we can kill this thread!:

There are two frequencies in use for the voice transmissions of a cellular phone call. 1. The cell site 2. The cell phone.
If you are listening to the cell site freq., then you will hear BOTH sides of the conversation. If you are listening to the cell phone freq., you will only hear ONE side of the conversation, which is the person talking on the cell phone.

1142. Albq. Center Freq.

: >uses triple conversion, the user manual appears (based on my very limited
: >knowledge) to suggest otherwise. Nowhere in the manual are the words
: >_triple_ or _conversion_ to be found. In fact the specification page
: >shows the following IF frequencies: the 1st IF is 609.005 - 613.5 MHz and
: >the 2nd IF is 48.5 MHz.

You should find another entry somewhere that says 3rd IF 455 kHz.

: This is the description of a triple conversion receiver.
: RF -> 1st IF first conversion
: 1st IF -> 2nd IF second conversion
: 2nd IF -> audio third conversion

This is wrong. You are describing a double conversion receiver. The step
from the final IF to audio is detection, not conversion.

: >All this creates another question. Given the IF frequencies for the 2035
: >how does one
: >compute 1105 to 1115 MHz as being the area where one would get cellular

: >frequency was an image was pretty straight forward. Double the IF to get
: >21.4 and add or subtract that value from the received frequency. Does
: >this formula not work for triple conversion scanners?

It would work, but the signals are likely to be very weak - since they are
so far from the cellular band.

The calculation would be approximately:
610*2 - 860 = 360 Mhz. The sum of the two is much too high.

Yep, and Andy is wrong about TV antennas to boot. My tower mounted yagi shows very distinct directional patterns, and you don't get them with a unity gain antenna.

For that matter, just about any antenna has gain over an isotropic reference. Because of the multiple elements, a TV has quite a bit of gain over a dipole reference.

Alan Corlin (ad747@lafn.org) wrote:

: I need some help with a "mystery" scanner. The scanner's frequency range is from

: 26-520MHZ. There is no name on it. On the rear of the unit is the standard FCC

: Type Accepted tag that reads. FCC ID:BGL9DMSX-400

: J.I.L

: MADE IN JAPAN

JIL = Jutan International Limited

JIL often sells electronic equipment under the names of: Citizen,
Strauss, Concerto. They also mass produce stuff that is private labled
by department stores like Sears and Radio Shack.

As a rule of thumb, their products are second and third rate - but that
may not be the case with this unit at all.

They are big in Toronto here and have warehouse sales just before
christmas and sell microwave ovens for 50$ and cheap walkie talkies for
15$ etc.

I don't buy any of their equipment because it is of such low quality.
The fact that your unit was made in Japan is rare and could possibly
indicate it's better than the rest of their stuff (which is made
mass-production style in other Asian countries).

Cheers!

Andy

PRESS RELEASE

Hollins Radio Data
Post Office Box 35002
Los Angeles, California 90035

FOR IMMEDIATE RELEASE

1996 POLICE CALL Adds a big "PLUS"

LOS ANGELES CALIFORNIA, October 24, 1995 - Publisher Gene Hughes has announced publication of the 1996 Edition of 'Police Call Plus', which combines award-winning, best selling 'Police Call' and 'Beyond Police Call' into one frequency directory, retaining all the features of both books. As has been the custom for 33 years, the entire Edition has been updated to reflect the thousands of frequency additions and changes during the past year.

Hughes explained, "'Beyond Police Call' was far more successful than we had anticipated, but from the very outset, readers began suggesting that we combine it with 'Police Call'. Then the cost of paper doubled, so it really made sense to do it."

Each of the nine regional volumes of 'Police Call Plus' is now two-books-in-one: 'Police Call' and 'Beyond Police Call'. This has resulted in an average increase of about 30% in the size of each volume. While price was increased to take into account the additional pages, the rising cost of paper has been absorbed by the Publisher. This makes 'Police Call Plus' an even better value.

'Police Call Plus' is sold by selected retail electronics dealers and mail order firms, as well as all Radio Shack stores. The suggested retail price of each volume is $12.99.

>be quite a while. The reason I think so, is I assume you live
>in the L.A. area. Obviously you know L.A. County and L.A. City
>are broke.

The LAPD is going to change to a new communications system that has been bought and paid for by a bond issue passed by L.A. voters a few years ago.

The system uses Motorola Sabre radios and will broadcast in the 484 MHz range. The radios have the ability to transmit digitally, but it is unclear at this point how much will be "in the clear".

I am on a local (L.A. Area) scanner radio board, and one of the other guys on the board works for the LAPD as a radio technician. In addition to the foregoing information, he said that the FCC is threatening to take away the new LAPD frequencies if the PD does not start using them soon. So, he expects more and more to move to 484 Mhz soon.

-Larry

>
I just bought an AOR 8000 from EEB. They also sell an interface for about $85.
I also got ScanCat Gold for about $90. Together (you may already know) they
can restore cellular to the unit. I did it, but had to get instr's from the
software mfr since the extra sheet wasn't in the book. Guess ya can't be
too careful of "big brother."

Anyway, it just has a short ribbon cable on it, so if there's one with
a longer cable, I'd get it instead. Need a ribbon to fit into the 8k, but
juggling ext's isn't fun. Not a big deal, but you wanted feedback.

I'm still reading the huge 8k instr. book. It almost does too much.

I have(d) a Bearcat 2500XLT which received cellular by poor design (intermod)
I'll probably sell it now that I have a "real" scanner! the 'cat
wasn't too bad, but I wanted continuous LF - UHF including SW. The
8k seemed like the ticket.

Why'd you get yours?

Dan

Fine Idea for a small system with light loading(5Ch).....

You will go nuts when you get into a 10 or 20 channel system....in the middle of a weekday.

If you do this be sure to seperate the speakers and place them in a circle or semi circle around you.

Really sounds practical for a small system...you could buy used radios and set the whole thing up for $200/$300.

Now if only you could get these cheap radios to automute when the data channel changes or that lovely "brings good things to life" tune pops on.

some
>competition, BUT, for the moment, it looks like if there isn't a lot of
>flash, blood, and/or gore, they don't care. Of course that doesn't keep
>them from covering anything that fits their political agenda.

Guess why we cover all that "Flash,Blood and Gore"??? Because *YOU* the viewers want to see it! Ever hear of a ratings book??? If people don't want to see that stuff on the news then why not turn it off? Sooner or later the ratings for that newscast will drop and change will come.

Before I get too "off topic" let me tell you a little story.....

My station tried to do a "Family Sensitive" Newscast...NO BLOOD....NO GORE...We did this for over a year. Guess what! NOBODY WATCHED!!! Now I'm back to covering drive-by shootings and DUI Accidents(YUCK!)

>Case in point::: earlier this year, we had a fire at a custom
>manufacturer
>where CYANIDE was used in Durham. Did the media cover this potential
>Bhopal?
>Nope! AND on top of that, and cyanide laced smoke probably would havee
>over
>the Research Triangle Park.

Oh,I see....
Your fire department ordered an evacuation of a business park and the surrounding area due to a very deadly toxic cloud and nobody covered it??? That's because the press did'nt want to die with the "citizens"...can you blame them...after all they/we listen to scanners for a living.

Oh wait......
Politics kept us away!!! Get real!

>So scan, the life you save may be your own!!

This *IS* very good advice.

That is my understanding of the true public service
nature of scanning. It has nothing to do with "checks and
balances" but instead is an act of community service.

>fires, suspicious activities, pursue DUIs, ect. Law

The only words in your entire post with which I take
issue are "pursue DUIs". No private citizen should become
THAT involved. Leave pursuit and apprehension to the pros.

The recent addendums to the ECPA are just a head-in-the-sand response to the POLITICAL pressure brought to bear by the cellular lobby. They didn't take communications privacy into account when they DESIGNED the system, and they want to be able to tell the customer who asks that is IS private (at least against the law) to some extent.

Stupid law written by the lawyers paid for by the cellular lobby, and passed by uninformed neanderthal politicians (who are probably ALSO paid for by the cellular lobby).

A law's ENFORCEABILITY should be considered before passing this kind of pointless legislation. This is just the first step in a process that will just make ALL reception of RF frequencies illegal.

>derek@tecogen.com

I work for a company that manufactures devices that connect to cellular
phones, and we have found the phones to be all over the map! Every
major family of product from evry manufacturer is DIFFERENT in terms of
construction, audio interface levels, connectors used, method of interfacing,
etc.

Some phone circuits can support higher speed data (14.4k or 9600 baud ops),
but many cannot, and you are lucky to get 1200 baud!

The phones are not the only culprit, but different cellular providers use
different brands of transmitters and MTSO switches, and these have so many
variants that the audio processing and quality varies widely.

It is amazing this stuff works at all sometimes! Good luck getting component level info on most cell phones ESPECIALLY anything made by Motorola!

I agree with most of the above. Just a nit-picky point,
though. The FCC does not enforce ECPA - the Justice
Department does. That means the FBI and/or Federal
Marshalls.

They are just as [dis]interested as the FCC, though,
unless of course somebody files a specific complaint.

I have a VLF Converter for sale.

It is made by Datong and converts the frequencies below 500kHz up to 28MHz. So you can tune them on any standard short wave receiver.

The converter is crystal controlled and powered from its own internal battery or an external 10-18volt DC supply.

[rest cut]

The fact that the police know that someone is listening is a deterrent in itself. A very low percentage of all CCTV installations actually catch criminals, because their presence deters crime.

On an aside, three police officers in the Dallas area are currently under investigation because a video camera has them "administering" pepper-based spray ("mace") to a handcuffed woman who was already in a cell. The police captain said (and I saw and heard him myself on the TV, not some reporter saying it) that what he saw was a "criminal assault". The police officers reportedly did not even understand why what they did was wrong.

How often does this happen? Not often. But once is enough to prove that the video cameras are needed. How often do police abuse their power? Frequently, in my experience. But not on the radio. If they knew no one was listening to their transmissions, then I think things would definitely deteriorate.

Just my $0.02.

While TV antennas are generally st up for VHF/UHF TV frequencies, that's really close to most of what you probably want to pick up on your scanner. 800 - 900 MHz is another story, but basically any antenna close to the right length for the freq.'s you want to hear will work. After all, do you tune the antenna on your car radio when you move up and down the dial? In my opinion, POP COMM is OK for a radio mag, but they really can be a bit misleading sometimes. If you are transmitting, you have to worry about tunes antennas and such. Scanning is a lot less sensitive in most cases (unless you want to pick up long range transmissions).

I just purchased a AOR 1000XLT. It came with a AC adapter and
Cigarette plug adapter. Unforntunately it did not come with a manual.
So my short term question is how do you change from one bank to
another?

Scan, Bank, Prog, (Bank Number), Limit, (Bank Number), Enter. For
instance if you wanted to scan banks 1, 2, 3, & 4 (sequential only with
the ar1000) you would press the following keys:

Scan
Bank
Prog
1
Limit
4
Enter

It's the same routine for search, too.

I have a Pro-2004 and want to upgrade my scanner. I know that 800 mhz is not in the new scanners and will probably retain my Pro-2004.

I would like a scanner that has good freq. coverage overall and really would like to do computer control with it. Looking for software control to database, scan, and whatever else i can do. I have seen the Opto Scan and seems to be very costly.

Are there any new scanners that come with a rs-232 port for immediate hook-up?

I have been away from the scanner activity and would like to get back into it. Suggestions please...

Cliff

I would expect this sort of problem if the equipment has been exposed to high humidity or moisture. My best guess is that the actual LCD display has intermittent connections to the LCD driver. Usually there is a 'rubbery' bar with parallel contacting sections which is squeezed between the display connections and a PC board with corresponding printed circuit connections. If you are prepared to dismantle the display, you could try carefully cleaning the PC board and LCD contacts with alcohol and then reassembling. Check that the LCD display is properly positioned. With any luck this should restore the full display. I believe there is a LCD Faq, too.
Good luck, Murray

If a police department trunked radio system is operated under
a private land mobile service license, it is not protected by the
ECPA. On appeal, I think a good attorney should be able to prove
that the judge step out of bounds and incorrectly applied the
federal law. **The ECPA expressly allows for monitoring of the
private land mobile service**. There may be state laws in question,
but I am not familiar with any details of this case. State laws
should be overturned on the basis that all radio services are
under the sole jurisdiction of the federal government, and by
statute, the FCC.

However - what is protected by the ECPA is programming information
for the trunked system. The proprietary hardware, software and
protocols, as well as the agencies fleet, sublfeet unit IDs are
not things that are made avaialble to the general public. This
information is protected. In other words, a police department
can claim protection under the ECPA if they find John Q Citizen
with a trunked radio that he has managed to have programmed with
the department's personality. A manufacturer such as Motorola
can pursue patent and copyright litigation against someone that
creates their own software for decoding proprietary protocols and
signalling.

ALL codes isn't possible. You will find different codes for each area.
Even APCO 10 codes ("10-4" and so on) are adapted from town to town. You
can probably find them for your area at your local (oh, well) Radio Shack.

This may have changed since I used an AR1000, but the only way to do it is to do a full system reset, which also erases the firmware that the set uses to tune and scan. You then have to reprogram the code from scratch - this was an interesting way of extending the frequency coverage of the first generation AR1000's.

Suggest you pick up Howard Bornstein's GUIDE TO THE AR1000 which describes the hardware mod needed to perform the reset, and how to recover afterwards.

1202. Pro 2004. How I solved problems.

Newsgroup: rec.radio.scanner
Date: 1995-10-30 00:00:00 UTC
From: shustak@parkcomm.iii.net
Message-ID: <473nvn$j6d@news.iii.net>
Source record: 247281

Back about three years or so ago (maybe more), I made the mistake of buying a Pro-2004 scanner from Radio Schlock. After making four trips to the service facility (each taking three months worth of turnaround time) to repair an intermittent with the microprocessor board, it finally died permanently.

Not wanting to waste another $50 service call, I threw it up on the shelf, and forgot about it.

This past month, I got motivated to try to repair the beast since my local police force in the big city went to a trunked radio system. Following the advice of a local rec.scanner reader, I yanked out the microprocessor board, and touched up all the solder joints.

Anyone who has opened one of these radios can attest to the poor quality of construction inside. Each solder joint had globs of excess rosin, and the joints bubbled no matter how long I held the iron to the connection. Luckily, none of the pads lifted off the board, and the microprocessor problem went away.

Well, another problem cropped up within weeks. The receiver went dead. I lost my temper, and ripped the whole radio apart to individual boards, and spent the entire day touching up ALL the joints in the radio. They were ALL filthy.

Result? A functioning radio. So far.....

If you own a 2004 and find intermittents, take a 20 - 25 watt iron, and CAREFULLY touch up the joints on the board (watching out for bridges). It solved my problems (finally).

The moral of the story is to open up the radio you wish to buy to check out manufacturing quality. My 210 XL was much nicer than the Schlock 2004 in this regard.

Chris

P.S. The sound squelch works great on those stupid trunking tones.

>We have a bad enough DUI problem that the civilian population HAD
>get involved with our State Highway Patrol.

I equate "had" with "must" (...as opposed to "should"). Think about it. I can support inserting the word "should" into the sentence above..but I cannot empirically state that simply because I or others own an electronic device that in all circumstances the word "must" dictate our behavior or response.

David, as my post lucidly stated, I support those who accurately report such incidents, but can find no reasonable justification for any form of "pursuit".

> I have done my fair share
> of DUI chases, and only one I had to do at speed.

I'm not sure what "at speed" means (nor is it really important), but if you had been seriously injured or orphaned your children would it have been worth it? I dunno, just asking out loud. Different people do different things...and this is not a one size fits all world. I publicly commed you for your oncern

But germane to this topic... -MUST- SCANNER AND CELLULAR OWNERS REPORT THOSE WHO THEY -SUSPECT- OF BEING UNDER THE INFLUENCE?
-SHOULD- THEY ADOPT A UNIVERSAL POLICY OF "PURSUING" THEM?

> The basic routine
> is to close up and get that tag #, fall back, and call *HP.

Bingo! That is exactly what any moral and ethical person should do. Quite frankly, that is all that is necessary.

> You then
>become a pair of eyes for dispach, who vectors SHP and other LEO units
>for the intercept.It CAN be done safely.

Sure it can. But remember what I said about impaired judgement of the suspected inebriate.

I had one scanner and cellular owner who was tailing what he supected to be a drunken driver...what happened was that the person he was "tailing" was a felon from a previous armed robbery who had used his ill gotten gains to buy a speedball (cocaine & heroin). Yes, the suspect did eventually did strike a tree. As the "do-gooder" approached the scene to

"check for injuries", the dirtbag rolled out of the car and blasted the "nice guy" twice in the chest with a revolver (he thought the "Good Sam" was an undercover officer). Yes, thankfully the Good Sam did survive... but he swore to me he would NEVER do that again. I say leave the "pursuits" to the cops...and live to actively report another "deuce" tomorrow!

>I will be happy to continue this discussion via E-Mail.

Naw, ..I'll pass on that. But if you wish to talk about something else.. please feel free to write.

>Now I'm gonna put YOU on the hot seat... ;)
>
>Let's say I witness an accident with PIs, After making the initial call
>to get Y'all rolling on it, what would you want called back to RESCOM

1212. Bearcat 220XLT Test modes

Newsgroup: rec.radio.scanner
Date: 1995-10-31 00:00:00 UTC
From: stone@flowbee.interaccess.com
Message-ID: <4768j5$2h5@nntp.interaccess.com>
Source record: 247219

I have seen that many of the past test modes for various bearcat scanners work w/the BC220XLT. Here is what I found

Power on with...

WX and L/O = voltage reading

2, 9, MAN = clears 9, L/O = screen test

2, 9, PRI = test freqs in 1-21 (note: the "out of band freqsbeen removed)

2, 9, SCAN = test freqs (same as above)

Here is my real question, what the hell is this?

Do the voltage reading; now while it is displayed hit a number like '1' The screen will read something like "UP 1.75" You can change this with the up'down arrows You can now hit 'WX' then the down arrow and it will say "LO 1.5" This also can be changed w/the up/down arrows

There are "UP"/"LO" settings like this for each number 0-9 (possibly refering to bank?)

Does anyne know what this is?

$50 million??!! HA! I laugh at your estimate!! ;-)
Here in Phoenix, the estimate to go to 800 trunked is $60 million minimum.
In LA, I'd have to guess the figure would be $100 million, easy.
That's just a guess, of course.

Realistic Pro-26 Handheld Scanner For Sale

$400 + I will pay for shipping (USA only please)
Call 818-707-2174 ask for Jeff

- INCLUDES 5 YEAR TSP EXTENDED WARRANTEE
- Top of the line scanner from Radio Shack
- 25-1300 mhz (no cellular)
- 200 channels
- In box with instructions

New from Radio shack will cost you $450 plus tax and $60 for the extended warrantee. That's $550 in Los Angeles (8.25% sales tax). Considering the TSP warrantee is included and is transferable (it follows the unit), this is a good deal.

I know SOME of you have nothing better to do than to respond every piece of E-Mail with your opinions of EVERYTHING different than the way you do things. It is rude for me to have to pay for internet time to go through opinion mail for an equipment sale posting. However, if you are interested in purchasing this unit please call the number above.

I own a Sportcat and have no complaints other than the lack of being able to specify a band width to
scan. The scanning ranges are programmed in. I use mine at Nascar races alot during the year and it
survives more than it's share of bumping and banging. I'll definitely buy another if and when this one
give's out.

I am currently serving on a committee for my fire dept which is studying the feasibility of a regional or countywide trunked public safety system. We recently had some manufacturers reps tell us that indeed, EF Johnson has been licensed to manufacture and sell radios compatible with Motorola SmartNet II systems and Astro digital systems. Supposedly, the radios will be Astro radios with backward compatibility to SmartNet.

2 or 3 other manufacturers have also been similarly licensed. Prices for trunked radios should be coming down to more reasonable levels in the next 2-3 years.

Andrew Cogswell (medman@qnet.com) wrote:
: Geez, why don't they just make it illegal to listen to anything on a
: scanner! Oh well, it's not like people are ever going to listen to those
: laws.

True. But that's NOT the point! The point is that you can have *your*
freedom taken completely away if you do listen in. Larry Gass is a case
in point. 85 years in prison for pissing off the Tulsa PD and monitoring,
selling monitor equipment for listening to non-encrypted traffic that can
be heard on *any* scanner!!!!!

Get a clue! This is a VERY dangerous precident *if* it goes thru. If it is
upheld all it will take to nail *you* under the same precident is to have
a cop with a hard-on for you using a trunked radio system find a DA to
file the charges and some dimwitted or unscruplious judge to convict you.
Heaven knows that in *some* parts of the country legal integrity is a
very nebulous thing!

The frightening thing is that the ECPA specifically _authorizes_ the
monitoring of non-encrypted, non-spread spectrum public safety
communications. The prosecutor successfully convinced this judge that the
trunking data constituted a modulation technique whose parameter were
witheld from the public domain to protect the privacy of the
communication and is therefore a protected segment of the ECPA.

Bang! Slam! Say goodby to Larry Gass and ANYONE else who may drop onto
any other Tulsa PD channel other than the 3 that the Tulsa Police Chief
has deemed OK to monitor. Who the hell is the TPD to say which channels
are OK to monitor and which are taboo??? Since when did *they* get
control over the airwaves. This case is a real rats nest when it comes to
future implications for monitors and saying " Oh well, it's not like
people are ever going to listen to those laws" is one of the STUPIDEST
things I've ever seen in this newsgroup!

Andrew, I don't mean to single you out for burning but your post was the
most convenient because it expressed a VERY common attitude. One which I
agree with, also.

Folks you gotta look beyond the concept of "unenforcable" laws because
somewhere there's _someone_ who just might be willing and able to find
another someone who might take it upon themselves TO enforce those laws.
If Larry swings for this then we're ALL in danger of the same future.

From: dana@spry.com
Message-ID: <478o13$3i7@data.interserv.net>
Source record: 247099

OK, I just bought a scanner (RS Pro-62), and my understanding is that new scanners do not pick up cellular transmissions. This is fine with me as I got the scanner to monitor police & fire calls and fun stuff like that...

However, I am picking up something odd, and am curious about why (technically) it is happening. I seem to pick up "voice mail" messages on one particular frequency in my area; they are all *for/from* different people. On that same frequency I also sometimes hear what sound like PA messages ("Larry, pick up your package at the front desk") from a particular company.

I don't know enough about scanners yet to know why this would happen... Is this the phone company voice mail? People's answering machines? An answering service?

Has anyone run into something like this before?

-Dana

p.s. in front of every message I do get a squelch-like tone that sounds a bit like an answering machine beep.

The UHF Flight Deck radios are different from the internal ships
communications. The 3 ships I've been on had Motorola HT's that we're a
special model (read more expensive) for ships. I want to say they are MTX
(?) HT's but I'm not sure. The Frequencies are usually stamped on the
back or theres a decal on them. Everyone I ever saw was in VHF Low.

1245. BC220 troubles

Curtis Wheeler (cwheeler@ccnet.com) wrote:
: However - what is protected by the ECPA is programming information
: for the trunked system. The proprietary hardware, software and
: protocols, as well as the agencies fleet, sublfeet unit IDs are
: not things that are made avaialble to the general public. This
: information is protected. In other words, a police department
: can claim protection under the ECPA if they find John Q Citizen
: with a trunked radio that he has managed to have programmed with
: the department's personality.

This is exactly the case that is cited. The problem is that the information that Mr. Gass received was broadcast in the clear and that could be monitored by any scanner. This case is in variance with the intent of the ECPA in that he's facing jail time for monitoring clear voice communciations in an authorized area.

: A manufacturer such as Motorola
: can pursue patent and copyright litigation against someone that
: creates their own software for decoding proprietary protocols and
: signalling.

Sure. And if Motorola want to sue him (Mr. Gass) for using pirated STX software for patent infringment I have no problem with that (well, not much anyway...) But he faces criminal charges, not for the theft or use of illegal software but for the act of monitoring channels that TPD said that the public shouldn't have access to even though they didn't bother to encrypt those channels. That I do have a problem with!

Hi Mike,

I just acquired a Sportcat last weekend and I've used it quite a bit. I like it. I live near a cell-phone site and the 800 MHz public service band on the Sportcat gets overloaded a bit sometimes. But the scanner is small and lightweight, and scans very fast. In search mode on the VHF bands, it's really fast (300 channels/second!). I hooked it up to a discone antenna on my roof, and it was less susceptible to cross modulation problems than my old BC200XLT was.

Note that if you are into cellular phone scanning, the Sportcat does not receive the cell band and it is not modifiable. You can pick up cell phone conversations as images, 21.6 MHz (not 21.7 MHz like the 200XLT) above the cell bands. Of course, I never do that because it's illegal.

Overall, I think it's a nice radio.

Cheers!

Andrew Clegg

1253. Opto 456 (535) Experience?

Newsgroup: rec.radio.scanner
Date: 1995-11-01 00:00:00 UTC
From: pcone@crl.com
Message-ID: <478rep$r94@crl14.crl.com>
Source record: 247113

I hope we can start a discussion about the OptoScan 456 (535) scanner controller and our experience using these devises with a scanner under computer control.

My personal motive? I am thinking about getting the OptoScan 535 w/ RS-2042. I have a need for a computer controlled scanner, because I'm a partial quad. Some of you gave me some great suggestions after my last question on this. Now that I've checked out the OptoScan 456 (535) I'm psyched about it. I read the information on the Optoelectronics WWW page.

I have ham buddies who own spectrum analysers, but I can't afford a spectrum analyser so the "spectrum analysis" features of ScanStar and the other software packages seem like a real plus. Do these really work? Do they help you follow "breaking news" events, like fires, etc. We live in forest fire territory and the scanning can be very intersting and fast moving. But, you can also lose track of what's going on without a view of the spectrum.

Also, importing databases sounds like a great feature. It helps you identify a lot of info on a station, including milage from your QTH.

My question is, does all this stuff really work and has anyone here got this stuff up and running? If so, please let us know how yo ulike this cool new technology. Thanks.

Also, the 2006 has a very good rep as a receiver. How does the RS-2042 compare? Thanks.

P.S. Cellular is not that improtant to me in a new radio. My RS-2022 covers cell. I know the RS-2042 does not recieve cell. Thanks.

Radio Shack's "PRO-60" 200 Channel, 30 MHz to 1 Gig (usual cell gaps). This unit does cover military air, too! Absolutely mint, no scratches nicks or dings. I am including as part of the deal an AC adapter, six nicads and lapel speaker, all purchased separately. (No manual/box).

This is a very high quality, triple conversion, scanner. List price is $379 in current Radio Shack Catalog. My price includes scanner, lapel speaker, nicads (used once), and 2 day shipping.

Asking $279 for all the items listed above, delivered via 2 day shipment anywhere in continental U.S.

If my memory serves me correctly, Motorola Radio part numbers beginning with
43 are High VHF band, and 44 indicates UHF Business Band.

Get one in your hand and pop off the door to the battery compartment. Most
radio shops put a sticker inside the battery door or in the compartment
behind the battery to indicate the frequency or frequencies the radio is
currently set up for.

>That sounds an awful lot like a RADIO to me. It's sort of like saying that
>listening in on CB or business band radios is illegal.
>Any thoughts or info?
>Phil

Yes it is illegal. Yes it has been tested in the courts. Yes, the law CAN
be enforced in some very special instances where:

A> Somebody saw you do it.

B> You recorded it and passed it on.

C> You admit that you did it.

If you never talk to anyone about what you heard, never did it in the presence
of other people, and never admitted it or recorded it, then the chances of
getting in trouble for it are slim.

Let's face it though, if you have a life of your own, it is really only
interesting for a few minutes. Like alot of radio communications, it can be
very ordinary and boring the majority of the time. It only really seems to be
important to those who have never done it, or don't have anything better to do.

DS> I would be very interested in examples of ways in which
DS> scanner monitors have actually participated in the
DS> governance process based on their interceptions of radio
DS> traffic. When, for example, has a scanner listener ever
DS> blown the whistle on police misconduct?

Here in Phoenix, there was an incident several months where a person was shot over 30 times by the police, in what several people called a violation of his civil rights.
Many scanners that night were listening (I'm one of them). We head the whole incident, from the first dispatch as domestic violence to the end.
This person assaulted his girlfriend, she called 911. He was armed with a shotgun, alcohol, PCP, and an attitude. he proceded to roam the streets of downtown Phoenix, randomly shooting at buildings, while the police got their tactical situation right. When they ordered him to drop his weapon, he fired at the police. They fired back. He went down, then sat up and pointed the shotgun at the police. they fired again. he went down, and proceded to get up, at which point the police fired again, killing him.
it was (and remains) very obvious that this man was a direct menace to society and to the police, yet some (including a local elected official) are still attempting to make him a "hero" of some sort, and they accuse the police of not atempting to 'talk him into putting his gun down'. Those of us who know what happened are continuing to tell it as we heard it, yet this ellected official still insists that the police is a racist organization (the perp was Hispanic).
I know this is the opposite of what most people are looking for in this thread, but I think it's appropriate.

DS> What is the scannist's role in local government? If we
DS> have one, I for one would be happy to both exercise the

UNIDEN BC-700A "800 MHZ" SCANNER

Hits:

+ Compact attractive base/mobile scanner.
+ Wide frequency coverage
+ Pre-programmed POLICE, FIRE, etc. bands.
+ Nice backlit LCD.
+ Fast "Turbo" scan (up to 100 channels per second)

Misses:

- No direct frequency entry.
- Search bands are fixed.
- 12.5K steps in the 800 MHZ band.
- The 50 or so programmable channels are scattered in various bands.

Heartland USA (800-229-2901) sells refurbished units for $129.

At that price this is an attractive unit to have as a second or
"kitchen" scanner. The audio is strong and clear and it is a lot of
fun scanning various services by just the one button. Using just the
included BNC telescope antenna I didn't notice any lack of sensitivity
for listening to signals at various frequencies.

On the down side there's a fair amount of imaging and intermod. Not a
real complaint as I assume that's par for the course for scanners with
this kind of range. If you want real scanner that's what God (I mean
Icom) created the R7000 for.

I recently bought one and seeing as it advertises itself as an 800 MHZ
scanner it was disapointing to find a gap at 870-890 in the coverage.
Fortunately there is a mod to solve this that I have included below.

All in all I am pleased with the unit. I really wish it had
programmable band edges for search mode and some lockouts but I find
myself using it a lot. With the preprogrammed bands like POLICE I am

hearing a lot of interesting calls that I otherwise would not have thought to program in the scanner.

CELLULAR RESTORATION:
(Modified from Brett Miller N7OLQ's original)

1. Remove the screws holding the case halves; separate them using care to unplug the speaker lead.

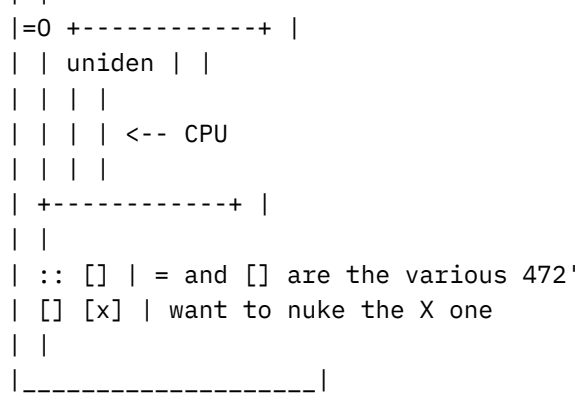
2. Turn the scanner upside-down with the face away from you.

3. Remove the two side screws holding the faceplate; tilt it forward.

4. Find the transparent cable. Using a jewelers screwdriver; CAREFULLY pry up and unplug the cable so that the faceplat can be tilted fully forward. Or alternately take out the black cable and tilt it the other way.

5. Locate the copper/plastic shield under the faceplate; unsolder and remove it.

6. Remove the resistor marked "472". There are 3 of these near the CPU. You want the "middle" one.



In removing it usually you can touch both sides of the chip with a soldering iron and have it lift up by being stuck to the tip of the iron. Be carful not to apply any force to have it lift the etch.

7. This completes the modification. Plug the cable back in place and test the scanner by entering 870.000 (channel spacing will be 12.5 kHz; not 30 kHz.

8. Reassemble the scanner. Be sure to tack the copper shield down again. I am sure you don't want any more internally generated EMI.

Happy Scanning!

1274. FS: $475 for Yupiteru MVT 8000 all-mode scanner

Newsgroup: rec.radio.scanner
Date: 1995-11-02 00:00:00 UTC
From: lmilrad@passport.ca
Message-ID: <47a453$69n@diplomatic.passport.ca>
Source record: 247038
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner

The MVT 8000 is a brilliantly designed angled front panel, 200 channel ac/dc scanner. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on my desk.
It covers 8 Mhz to 1300 Mhz and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.
Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:
Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)
Of course, you can change factory settings. It also has a battery save function.

1278. Surely someone knows the answer ... cell tracking codes???

Newsgroup: rec.radio.scanner
Date: 1995-11-02 00:00:00 UTC
From: alioth@ix.netcom.com
Message-ID: <479i2k$mjv@ixnews3.ix.netcom.com>
Source record: 247042

I know that it's not legal to listen to cellular phones. I am not a lawyer but I am under the impression that it is legal to listen to our public servents communicate by radio ... trunked or not n'est pas??? Well I think so at least. When I listen to the police or the water department or the traffic light setters or the medivac unit or the plumbing inspector talk over radios that I bought for them with my tax money this is legal and even sometimes fun. The communications act of 1936 gives me this right. So when or if they convert to trunked communication that is not scrambled I can still listen ... right? So here's the question:
Let's say that a public servent begins communicating on a single cell frequency ... and the cell computer instructs the portable transceiver to switch to another frequency (for whatever reason) ... I then as a listener to the event must find the new frequency ... which I might do if I'm lucky and the freqs are not clogged or if I had a panoramic receiver which tuned to the latest event ... or perhaps I could interpret the cell computer's instructions and follow them by switching to the correct new frequency. So the question is how do I interpret the cell computers instructions and switch to that new frequency. I have heard that the problem with selling software that does this is that the switching protocol is copyrited. Perhaps so and perhaps not. If I had the codes perhaps I could write the software for my own use. Perhaps I could even post it for all to examine for their own technical evaluation.
Please understand that this is directed at trunked communications of our public servants ... not the yuppie variety (the dreded cellular phone) that everyone has in their SUV. If anyone is still with me at this point what do you know? Thanks guys and gals.

P44QLC20A2AA is the Model Number for a Motorola P110 4-watt/ 2-channel UHF radio. The band range for this radio is 438 MHZ to 470 MHZ. Your best bet to find out the frequency is finding someone who has a frequency counter to read the radios actual transmitting frequency.

Good Luck!!

Brian

1283. [WANT ADVICE] AR-8000 vs Pro-26

Newsgroup: rec.radio.scanner
Date: 1995-11-02 00:00:00 UTC
From: scotte@ccs.neu.edu
Message-ID: <47afg5$gf4@camelot.ccs.neu.edu>
Source record: 247047

I just received my Grove catalog, an am debating between buying the AOR AR-8000 scanner and the Radio Shack PRO-26 scanner.

The AR-8000 is $599.95 in the catalog, and the PRO-26 in the catalog is $349.95.

Both have selectable AM/NFM/WFM. The 8000 also has SSB, but I question the true sensitivity with lower frequencies. I would think a shortwave radio would do better below ~30 Mhz.

Bottom line: is the extra cost of the 8000 in the extra goodies (LCD display, bargraph, RS-232 capability, etc) or does it have good performance?

How is the Pro-26's performance? Is its performance better overall to permit saving some money?

I'm after two main areas: Wide coverage receive with ears, and good rejection of unwanted signals. I have a funny feeling the PRO-26 will be the preferred radio, but I'll wait and see.

It's also nice having a Radio Shack every feet :-)

Thanks for any help.

What you are hearing are paging mssgs. There are paging systems available (usually on the business bands) that a store or factory can purchase that is basically a radio system that allows the base operater to page individuals. They wear what looks like a pager which when the correct tone is sent the receiver opens and they hear the transmition very much like a digital squelch. It is very similar to the plectron pagers the firemen wear.

I don't post here usually 'cuz I don't have anything interesting to say, but this is one of my favorite newsgroups to read, and maybe I will post more in the future. Anyhow, I wanted to let you all know that I got some really good catalogs in the mail yesterday. They are from Jan Distributing which is local here in town, but they deal with mail order a lot and stuff can be shipped to your door. They have some pretty cool stuff and I thought I would let you all know about it.

They have 6 lines of catalogs, and they can mail them out to you. I bought the Christmas catalog, the Major Appliances & Electronics catalog, and the Personal Shoppers Catalog. I was really impressed. They have just about everything I want for my Christmas List (except a million dollars HEE!)

Anyhow, Just thought I would let you know about these people. I went over and got a list of catalogs and prices to post here on the internet.

1) Christmas Catalog $7.00
2) Personal Shoppers $10.00
3) Health & Fitness $6.00
4) Major Appliances
& Electronics $5.00
5) Office Products $6.00
6) Profesional
Maintenence &
cleaning $5.00

If you need their address it is as follows:

Jan Distributing
18 International Village
Rolla, MO 65401

Well, gonna run now and figure up more of my christmas wish list...See Ya!

1293. Re: Trunked Radio systems and the law

Newsgroup: rec.radio.scanner
Date: 1995-11-02 00:00:00 UTC
From: NCZN58B@prodigy.com
Message-ID: <47b07r$184i@usenetw1.news.prodigy.com>
Source record: 247057

Various ramblings on and off the subject:

Gwinnett County Georgia got a new trunked system just over a year ago, one with a phone patch option, and one of the first things I can remember hearing was someone from the local DA discussing a raid SCHEDULED FOR THAT AFTERNOON! Since then they seem to have made county employees aware of the fact that this is even less secure than cellular.

Regarding the "pursuit" of an intoxicated driver, I think the important consideration is the difference between "follow" and "pursue". To me, pursue would indicate somone who is attempting to stay with the dui, no matter what, which is probably not a good idea. Following this person, while communicating the location to the police via cellular, provided it can be done safely should not be a problem.

Regarding the statement that dispatchers will ask for all pertinent information, in many cases, this just isn't true. I had an accident, a minor fender bender, to which the police were called. The dispatcher never asked about injuries, road blockage or fire, none of which existed at this scene, and hung up immediately after I gave the location. Next thing I knew, we had two cruisers, a rescue unit, a med unit, and a fire engine. The deputy demanded to know why I hadn't told the dispatcher that this was a minor accident, and seemed unsurprised at the fact that they had hung up. Last week, I called the police because some jerk was following his wife up the street trying to run her over. Instead of sending help, the dispatcher seemed to want to argue with me over the name of the restaurant I had given as a landmark, even though he made it clear that he did know where I was talking about. My own personal rule is to try to get ALL of the important information in the first sentence.

2 to 4 wire conversion would only be required if the cellular carriers
were processing calls on analog systems. I don't know of any cellular
service providers that are using analog. The cell sites generally put
traffic right into a channel bank where it is handled digitally to the
MTSO. Traffic between the MTSO and the PSTN is usually trunked on at
least DS3 facilities.

You are getting voice pagers, they are the old pagers before we had the
dig. despay. Some companys are using the for internal paging.

Jack.

DA>-Dana

DA>p.s. in front of every message I do get a squelch-like tone that sounds a bi
DA>like an answering machine beep.

you're hearing a nifty antiquated paging sytem called "voice paging"

the nifty little tones you hear before each page are the tones that
activate each specific pager so the squelch opens on the pager and the
audio message comes through.

voice pagers generally suck, but some people still use them. why, i
have no idea. i prefer my motorola advisor. at least i don't have to
worry about not being able to understand someone's accent.

Hello everyone!

I just bought a PRO-50 20 channel programmable scanner from radio shack recently, and got a listings of the channels around Granbury (where I live) sure is kinda boring, small town, nothing much happens. Is there anything I can do with this thing that is fun? =) If anyone lives around granbury, what are some interesting freq's? How can I find out the frequencies of the local hand-held walkie-talkies that the security officers and principles use at my highschool? How can I find more frequencies? Etc. =) Please reply to me via e-mail also, since I don't have time to wade threw this conference often =) Thanks!!!

>and lost it...Does anyone know that kind of diode that is?

>Please Email amontag@interserv.com

Should be just a simple signal diode. A 1N914 or 1N4148 (the two most common diodes on the planet) would work, EVEN if you couldn't find the tiny surface mount varieties. If they will physically fit in some fashion, and they are installed in the proper orientation (diodes do have a polarity, they would work as a diode otherwise) they should do the job.

This application isn't critical.

Steve

If you can locate a distributor for MX-COM integrated circuits, they sell the
chips to do this, and have very basic schematics in their application notes
for the chips.

1313. Where do I get HB232

Newsgroup: rec.radio.scanner
Date: 1995-11-02 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.5253.7592.0NFBB746@woodybbs.com>
Source record: 247077

Subject: Where do I get HB232

The HB-232 Scanner/Computer Interface is undergoing an evolutionary path and has been renamed the CE-232. Specifications remain unchanged and more will be added in time.

Briefly, the CE-232 Scanner/Computer Interface is a 2-way interface designed for the Realistic PRO-2004, PRO-2005, & PRO-2006 scanner series. It is specified for an IBM PC/compatible running MS-DOS v3.1 or higher, with 512-k of RAM, min. A hard drive is preferred, though operation from a 3.5" floppy can be done. Operation from a 5.25" floppy is possible, but probably a nightmare. Hard drive free space required is about 2-Mb or so. CE-232 is available as a KIT or preassembled/tested board. Installs inside scanner or in an external metal box. Connects between the PC's COM1 or COM2 port via a serial cable; 19-wires connect to scanner at key places. Comes with program disk and detailed manual.

The CE-232 does the following things:

* AutoPrograms the scanner from an ASCII text file; 400-ch in 8-mins

Example Prog line: [,21,346.100,am,D,L,] This programs ch-21 with 346.1 MHz, sets DELAY and Lockout functions.

* AutoLogs "hits" to a text file. Each line of the LOG file covers the "hit" with recording of channel, frequency, mode & delay settings, other mode settings, search increment (if used), date & time of logging, and duration (in seconds) of the "hit". Other optional data can also be logged to the file.

Example logging:[, 7, 859.2750,nfm, , ,SrUp,12.5,930902,220553,000002,]
Data shows: Search Bank 7, 859.275 MHz "hit", nfm-mode, Searching Up, at 12.5 KHz increments; logged on Sept 2, 1993 at 10:05:53pm, and lasted for 2 seconds.

* AutoLOOKsUp from a previously defined file and displays a text line to show the I.D. of a "hit".

Example LOOKUP: [,169, 241.400,am,D,,Blue Angels - Air to Air Channel]

* AutoREJECTs "birdies" and other undesirable signals as may be defined in a Reject List. (Keeps the scanner from staying locked on a birdie or other undesired signal!)
* Displays a facsimile on the PC's monitor of the scanner's keyboard and LCD Display, where all display and control functions of the scanner are faithfully reproduced with exception of SQeulch, Vol control and light.
* Offers automation of hundreds of scanner tasks through a Script Feature.

```
* Many more functions/features too numerous to list here
```

Dear "Watergate"

I am the possesor of two Motorola ASTRO's from my Department (one on 800 MHz conventional and the other on the "Med" frequencies). I was informed by my techies that while they appear similar, it was not possible to program both 800 MHz and UHF/UHF-T on the same radio. I do imagine that they were telling the truth as our (bulk purchase rate) price for these radios exceeds $3K apiece.....they would -love- if I didn't require two.

My best advice?

Contact a knowledgeable Motorola dealer.

Monitor Safely!

Brian Humphrey

> -Brian KE6NCQ

That brings up a point. Given there are so many agencies and police
departments in L.A. County, and the surrounding areas, with the need
for police agencies/cars to listen to one another (e.g. a car pursuit
going through many cities) how can one police department go digital
and not allow the other police departments listen in? I don't know,
but if they had to put in a police car all the radio equipment
needed to listen to 80 different police departments in L.A. County,
each using their own digital equipment, the police car would be
so heavy full of radio equipment, it couldn't move.

454.775/459.775 is a standard freq pair used by an aircraft telephone
network interconnect system (rendered somewhat obsolete by the 800MHz
Airphone & newer INMARSAT-based systems).

You apparently happened to catch an aircraft directly on the input.
Tune in exactly 5MHz lower & you'll hear the ground-side of the circuit,
& a few other 454/459MHz channels should have similar useage in your area.

actually it's the FBI and they want the tecos to provide up to 1% of their system capacity for phone tapping in high crime (1.e. urban) areas. Scares the hell out of me!! What are there real intentions? Why so many simultaneous taps? Sounds very Orwellian to me.....

Of course! Everyone knows that Hispanics are routinely stalked and persecuted by the racist police departments across the country. Doens't matter if the suspect is armed, on drugs, shooting randomly, or whatever. It's the fault of the police!

If the perp were a white man, I guarantee you wouldn't hear a word out of these "civil rights" folks.

1343. [WANT ADVICE] AR-8000 vs Pro-26

Newsgroup: rec.radio.scanner
Date: 1995-11-03 00:00:00 UTC
From: Mike.Coletta@commctr.com
Message-ID: <4a0_9511031015@commctr.com>
Source record: 247000

I too debated the question "Should I trade in my Pro-26 for the AR8000?
"
After reading several articles on the AR8000 I decided to keep the 26.
It scans faster, comsumes less battery power, has better adj signal
rejection, and is alot less expensive. I enjoy the Pro-26 because of
its size and use of only 4 AA batteries. I also have the BC3000XLT
which is
a great scanner. Neither have the full 800 MHz but thats only a small
part of the band which is active. As far as lower signal reception a
shortwave receiver would do just fine. I've got a Icom R1 that
receives
100 KHz - 1300 MHz with no gaps and the lower freq signals don't come
in
as good as a dedicated shortwave receiver even with the same antenna
hooked up. I don't know how the AR8000 receives these but I would
imagine the higher freq signals would open the receive circuitry alot
easier due to the signal strength, etc. Happy Scanning !!!

>interface) would mind sending me feedback (positives, negatives,
>shortcomings etc.)
>

I've got one, with plans to mod the other two 2006's I have
to also function with the CE-232 box. Also planning to mod the Pro-43
to do the same.

I had a ball building the unit, but you can also buy it fully assembled.
Bill is offering the unit at a holiday price, so now is the time to buy.

I am quite pleased with the CE-232 and the quality of support Bill
offers. I'd buy one in a minute.

Mark

>
>Steve

The employee at my office that builds our radio communicators
uses some equipment to tune our radio transmitters tht we use
to transmit alarm signals. When the machine is not being used
for this purpose (90% of the time), it is constantly monitoring
cellular phone calls. This "background noise" is supplying this
fool with the same pleasure that a radio station supplies most
other people during their work day.

Anyone can come and go and listen to the babble on the cell
phones. For the first 5 minutes it is interesting. After that,
it is boring, repetitious, and idiotic.

Personally, I don't think it SHOULD BE illegal, and if I
enjoyed listening to it, I would despite the law. But it just
so happens that its no fun.

>
>
>Cheers
>
>
>Dave
>
The WX key puts the scanner in a mode that searches the NOAA weather
frequencies which are 162.4 to 162.55 MHz. The scanner will stop
on the first active weather frequency it finds. A second push on the
key will start the scan from the point where it stopped. The scanner
will then stop on the next active frequency. If none of the frequencies
are active, the scanner will simply continue to scan the above band until
told to do something else, eg push 'SCAN' or 'MANUAL'.

I have a new portable scanner (RS Pro-62) and am using the built-in antenna.
I understand from the FAQ I d'loaded from this newsgroup that the
antennas that come with these units are not that good and that
I can improve my reception with a replacement antenna.

I'd like to know what increased range I could conceivably expect with a
new antenna. The broadcasts I am getting are reasonably clear, I just want
to get more!

Would appreciate any specific endorsements of replacement antennas, too...

TIA,
Dana

: I wholeheartedly agree. The simple act of owning a monitor radio (or for
: that matter a cell phone, CB or Ham radio) does not in any way whatsoever
: train or certify a civilian to conduct any activity that might be
: considered a "pursuit" (regardless of the speed or other circumstances).

: It is a personally and morally commendable for any civilian (with or
: without a scanner) to report such activity to Law Enforcement. But given
: that it is not uncommon for an impaired driver to behave in an impaired
: fashion, the monitoring enthusiast who should choose to "pursue" a drunk
: is just as inappropriate as one who would decide to pursue a fleeing
: armed felon.

I disagree.

If a scannist, ham or CMT owner spots a drunk driver (or any other
criminal) it is their duty to report it. If one can aid in the
apprehension of said criminal without getting in the way or endangering
others, then go for it.

Some people tend to be a *little* to enthusiastic with this stuff though
I must admit. 8-D

If you were in a position to pull someone from a burning vehicle after an
accident would you wait for the fire department to arrive? Of course
not.

If a drunk is on the road, everybody is in danger.

Curtis Wheeler (cwheeler@ccnet.com) wrote:

: However - what is protected by the ECPA is programming information
: for the trunked system. The proprietary hardware, software and
: protocols, as well as the agencies fleet, sublfeet unit IDs are
: not things that are made avaialble to the general public. This
: information is protected. In other words, a police department
: can claim protection under the ECPA if they find John Q Citizen
: with a trunked radio that he has managed to have programmed with
: the department's personality. A manufacturer such as Motorola
: can pursue patent and copyright litigation against someone that
: creates their own software for decoding proprietary protocols and
: signalling.

I can't see this at all. If a person was pirating Motorola's
firmware/software to listen then I can see a problem. If someone writes
their own software/firmware to decode something already on the air then
more power to them.

I get the impression that Motorola is a suspicious company and thinks
that their products are so good that everyone wants to rip them off. The
reality of the situation is that others can and do do it better.
Motorola's trunking system is the worst one anyway.

Cheers!

Andy

Hi Robert
I have that RS Freq counter to and it does work well for me.
Normally a clearance sale on such a item at RS will bring closer to
a 50% reduction in price or at least that is what I've noticed in the
past.

Ben

The Model P44... tells you that it is UHF 4W radio (could be anywhere
from 440-512), but usually 450-470. The 1st digit is the frequency range
3 VHF, 4 UHF, 1 or 2(?) low band 30-50 MHz. The second digit ias the
power 3 < 5 watts, 4 5 watts , 5 - 9 higher power for mobiles. I'm not
sure about the P110, but the HT 600 is programmed by Motorola software
and a RIB Box. The RIB boxes are always for sale, but the software
(legally) must come from Motorola (and is very expensive).

Hi Guys:

I seem to have missed the intro to this discussion and am interested to know what you both think of the frequency counter and how much is it on sale for. I'm in Canada and there is no sale here and even with normal exchange rates, the unit is more expensive in Canada...SO, I may well be interested in buying it Stateside.

Regards.

Lou

OK, so nobody wants my damn camcorder; how about my classic Tandy M102 original portable computer. 32k, 8x40 display, hard cover, manuals, all original cables, telephone connector, serial, etc. Excellent condition: would not sell for less than $200 (again my value). If you aren't familiar with this great little machine, it has built-in 300 baud modem, full-size keyboard, 20 hours on 4 AA batteries, total collectors item (still in use by many journalists).

Somebody has got to have a "second" radio that would suffice to trade!

Thanks.

The MVT 8000 is a brilliantly designed angled front panel, 200 channel ac/dc scanner. It has a mounting bracket for mobile use and comes with a cigarette lighter adapter although it can be hard wired. I use mine as a desktop unit in my office. Due to its small footprint, it occupies very little space on my desk.
It covers 8 Mhz to 1300 Mhz (continuous without blockage) and receives in WFM, NFM and AM. Frequency steps are 5,10,12.5,50 and 100 Khz. It's got a 10 band search function, pass memory function, and other goodies found in high-end scanners.
Although seemingly assigned on the front panel by preset factory settings, searches are categorized to conform to channel numbering as follows:

Channel No. Band

1 FM
2 Air V
3 Air U
4 Ham V
5 Fire
6 Marine
7 Police U
8 Ham U
9 MCA
10 PRNSL (903.0375-904.9875)

Of course, you can change factory settings. It also has a battery save function.

KN> monitoring, selling monitor equipment for listening to non-encrypted
KN> traffic that can be heard on *any* scanner!!!!!

Larry Gass was convicted (among other things) of violating the ECPA by using an unauthorized (read: stolen) version of a proprietary software package to illegally program radios to follow talk groups on a trunking system. This *cannot* be done on a scanner (which is why the judge kept rejecting any talk of scanners).
I'm no lawyer, but it would seem to me that this is a good bust. He knew exactly what he was doing.
However, the conviction for just listening to the trunked system was, IMO, wrong, and should be overturned on appeal.

I don't think so.
I've never seen anyone able to show where anyone was convicted under the
ECPA of monitoring cell phones. Convicted under *other* provisions, usually
for making use of info gained, but never for just listening.
Also, the Gass case has nothing to do with cell phones at all.

GA> have a BC120XLT scanner. Is it so loose that this paging system is
GA> able to bleed all over it so much?

You have several things going against you, here:
Pagers are notorious for being extremely high-powered, and not always maintained as well as could be. That is, they tend to overwhelm a scanner.
The scanner you are using is double conversion, and as such, not very good at hiding intermod.
Bearcat scanners are a little more sensitive than Radio Shack scanners, as a group. This is not bad by itself; the problem is that sensitivity and selectivity are inversely connected. When sensitivity goes up, selectivity goes down (unless expensive steps are taken).
This lower selectivity shows up exactly as you describe.

There are things you can try. If you are using an external (outside) antenna, you can put an attenuator in the cable. You can try another antenna; if it's not as good, it may work better (remember, the problem is *too much* signal getting to the scanner).
Hope this helps.

The same way the media does. I ignore it. ;-)
It seems to me that that part of the law is being interpreted to mean it's
illegal to either make some sort of actual gain, or to attempt to use the
info for some harm.
Since I do neither, no-one seems to be bothering me about it.

On this note, I have wondered if Gass would have been ignored if he hadn't
made such an as**ole out of himself to the authorities.
Whatcha think?

Message-ID: <57c_9511051530@castle.shore.net>
Source record: 246961

The BC210XLT has Twin Turbo Scan & Search-- This lighting-fast technology enables the BC21XLT to scan nearly 100 channels per second. Search speed is selectable between 100 and 300 steps per second. (300 steps per second only in bands with 5 KHz steps.)

200 channels--You can program each of these memory channels to store one frequency.

12 Bands, 10 Banks--- Includes 12 Bands, with Aircraft and 800MHz. 10 Banks of 20 channels each are useful for storing similar frequencies in order to maitain faster scanning cycles...

20MHz-956MHz---Indicates the range of frequencies that can be searched within the bands of the scanner. (Note: The frequency coverage is not totally continuous from 29.0MHz to 956MHz.)

10 Priorty Channels-- You can assign one Priorty Channel in each Bank. Assigning priorty channels allows you to keep track of activity on your most important channel(s) while monitoring other channels for transmissions. (Priorty channels are initially set in the first channel in each Bank.)

Preprogrammed Service (SVC) Search---Allows you to toggle through preprogrammed police, fire/emergency, aircraft and marine frequencies...

Weather Channels---Lets your scanner function as a weather information radio...

Unique Data Skip---Allows you the scanner to skip over unwanted data transmissions and reduces birdies...

Memory Backup---The stored channels are retained in memory for at least 3 days, and typically 14 days, when the Battery Pack is removed from the scanner....

PS: I hopes this helps you out....I've got one these, and it performs extremely well...Very sensitive, and tough to boot....

I particularly like the search mode...Enter a freq. then press limit, and enter another freq. and press limit and it will search those freqs. and anything in between.... Let me know how you make out with it....Norman

... I haven't lost my mind; it's backed up on tape somewhere!

Thanks Jim for posting my Web site - it is brand new and just created with lots of information of value if you are interested in pager interception.

As far as the price, the value/price is always debatable. I received several orders from Law Inforcement agencies who follow Drug Deals through pager interception. In telephone conversations, they talk about what a great price for a reliable interception system and that my competitors (commercial) charge $5,000 for a similar system with a receiver.

For the hobbiest, anything above free is expensive :) The market usually will judge what they need and pay for. If you want to play with audio levels vs. bit error rate, freeware or $100 packages are available. Even for the hobbiest, $200 will not break the bank for a commercial-grade pager package. My customers are happy spending $200 for what they are getting.

>

Are there any interesting freq's at all to listen to during football games then? I have season tickets to the Cincinnati Bengals and have thought about bringing my Pro-39 along to hear what I could hear.

The referee calling the penalty would be great to pick up, because invariably the biggest cause of confusion in our section is "What the hell did that guy just say?"

How about the sidelines sending in the plays to the QB? Yea, I know it will most likely be all in odd code-speak, but I should be able to figure out most of it after a while and be able to determine what should happen?

They must call in the injury carts with radio, no?

Anything else?

In the Grove catalogue, they advertise they can mod the 7100 to unlock the 800-900Mhz for $40.00 plus shipping. Maybe IF they're nice, they would fax/E-mail you the mod (???)

Try monitoring freqs used by the stadium in the business band. Last summer
I heard the security detail at Wrigley Field trying to deal with the
inevitable rowdy fans. They have their own "pokey".

I am looking for a inexpensive (cheap :)>.) scanner. I am going to modify front end so needs to be a desktop rather than a portable. Want to run off 12 vdc as will be used in the field. The scanner will be used for receiving NOAA satellite images on 137.5 M Hz and has to have a bandwidth of at least 40 K Hz, so will not be any good for normal scanner usage once modified. Something like a Uniden Bearcat 142 XL. Anyone hve such a animal laying arounf they would likw to part with at a reasonable price. If so please send e-mail to rolape@cpcug.org or call 202-331-8816 after 4:00 pm EST. TIA

Have a nice day... Jerry R

In the back of police call it mentions freq. range 869-894 are common carrier, i.e. cellular phone? Anyway, it mentions the freq. spacing is 0.030 KHz, so if your scanner like mine only steps from 5, 12.5 25 khz there will be frequencies that will never be picked up. True or False? The European Radioshank Pro-26 also steps to 50KHz but is restricted. Why?

Take it easy,

They are talking about OTAR not ACARS. OTAR is a means of sending a new encryption key over the air to the agents in the field. Hence: Over The Air Rekeying. Previously every agent had to return to a central point to have their DES encryption key loaded into each radio. OTAR eliminates this hassle so the agency can change the key more often.

That was the FBI, not the CIA.
the CIA is not allowed to (legally) do any phone taps in the US.

CC> Sounds like they will be investing in a boatload of scanners soon.

Scanners won't do what the FBI wants to do: tap directly into the digital
systems that are coming.
With a desire to have the capacity for that many taps (over 1000
simultaneously), it makes one wonder how many they do now? (they had
authorization for only about 850 in 1994)

AM> How can it be a waste of money if they are not enforcing it?

We aren't just talking about the Government's money (although that's
really our money).
The rules don't say the scanners can't be modified, but rather that they
can't be "easily" modified.
Grove is advertising that they can unlock cellular bands for a price. If the
TDDRA hadn't been passed, that price wouldn't have to be paid by anyone.
Also, of course, the cell companies spent a *huge* amount of money to get
the TDDRA written the way they wanted it. That wastes the money of cellular
customers.
Then, we paid the congresscritters while they debated & passed the TDDRA (a
genuine waste of money, there).
Does this help?

No URL I know of, here's the info out of their ad (which appears regularly in
every scanner/communications magazine on the planet):

(800) 327-5912 Orders
(305) 771-2050 Information
(305) 771-2052 Fax

They are in Ft. Lauderdale, Florida.

>the case . Thanks in advance

I cannot speak with any authority on the AR8000, but I had a whole collection
of strange and unwanted operations occurring on an AR1000XLT handheld scanner.
I had to completely reboot/reprogram the scanner to bring it back to normal.

The AR1000XLT requires hardware mods to do this (and they aren't for the
faint-hearted), but I would think such a thing could be done to the AR8000
from the keypad. WARNING....on the AR1000XLT, all stored frequency info is
lost if you do a complete reset. The scanner is completely reset to factory
configuration. I don't know about the AR8000....different beast.

Have you visited the AR8000 homepage on the web?

Don't have the URL handy, but it can be found (along with other AOR info) at

www.demon.co.uk/javiation/

I have a Bendix/King model LPI 5142 A. A niffty 150 MHz(?) handheld with a keypad on
the front, LCD display, 14 channel wafer switch, Lo/Hi power TX,
Squel/CG switch, and a scan function. I believe this little guy can be
programmed using the key pad? The problem is I don't know how to get the
mother into "program" mode so it will take some new frequencies.

Any of you played with one of these little gems/monsters before.

E-Mail Greg.Bailey@SDSU.edu

Much thanks

G. Bailey, K6QPV

BN> yagi shows very distinct directional patterns, and you don't get
BN> them with a unity gain antenna.
Years ago, in Centerville TN, I used a corner reflector VHF TV antenna,
as a beam with a scanner. Comparing it to a 1/4 wave antenna, where I
could hear 1 weather station, the beam picked up 3 different weather
broadcasts, dependent on which way it was pointed.

Sounds like gain to me. (G)

I got into scanning as a result of a particular hobby. I am a dedicated aviation fan. I take pictures of aircraft from the most exciting to the most boring. I like to watch them do anything, or admire them doing nothing. I got into scanning so I could hear ATC talking to the aircraft so I would know what they are doing and when. When I got my first scanner, I learned about other frequencies to listen to. It's a great thing to listen to when you are just wasting time to start with. You never know what you'll hear.

The Navy uses frequencies all over the spectrum. It starts very low at
ELF for slow speed shore to ship messages all thew way to UHF satelite
frequencies. There is alot of traffic in various parts of the HF
bands. The VHF and UHF radios are mostly marine band radios and
air trafic stuff. Sorry I don't have specific freq's, but I hope this
helps.

These units use "channel elements" which have actual crystals in them.

Cheapest way to change freqs is to carefully pry open an element and then figure out what the crystal freq <==> channel
relationship is then get a new xtal. The manual would help alot here.

These radios are quite solid and reliable and work nicely on ham.

So, what about if I have a method of following a trunked conversation
WITHOUT prior knowledge of the pattern of channel changing?

It is actually quite obvious - if I mention it, lots of people will understand
what I mean and that it will work (however, it does require equipment
that not everyone has).

If you do not need to use ANY proprietary information OF ANY SORT,
is it still illegal to listen?

..Peter

I can't help with freqs for Indianapolis, but can pass on that a friend of mine was over that way a year or so ago and told in no uncertain terms that his mobile scanner was in violation of Indiana law. Seems that any radio capable of picking up police, fire, or other public service type calls cannot be used in a mobile environment (i.e., your car, on foot, your bike, etc). You can sit at home and listen, just not carry it around and listen.

I believe I heard this law doesn't apply if you are a memeber of a volunteer service such as a volunteer fire department or reserve police officer or are an accredited memeber of the news media.

Good luck and good scanning there.

I believe that the ranges cut out are from 825-850MHz and 870-895MHz. The lower band covers the mobile portion of the cell system and the upper the repeated cell system output.

If you have an 800 MHz frequency that you listen to close to either end of these boundries, make sure the scanner will allow you to enter it. The cutoff frequencies (in my experience) are not precise and tend to run into the regular commercial 800 MHz radio band.

I can recommend a general-purpose program that allows you to do analysis
of audio - say if you digitized your DTMF audio into a .wav file. Look
for cool150.zip. You can do spectrum analysis on the audio, and figure
out the
DTMF codes from the display. You can do lots of other interesting
technical things too!

Could be one of a couple of things, depending on just where you were listening:

-one of the newer cordless phones in that range that are not digital or spread spectrum

- Ham phone patch traffic in the 902 amateur band

No, they cannot "trace" scanners. At least not easily. I guess in theory
a given scanner type may radiate a slightly different signal (called
"Birdies", and every receiver has them) depending on what frequency was
tuned...but I wouldn't count on the FCC being able to deal with
that...now the NSA on the other hand....

But they wouldn't care about you listening in on an FBI freq.

Peter

Cell calls are spaced at 30khz not .030 khz. The Pro 26UK and Pro26
American both are spaced at a default of 12.5khz in this range. You
will not miss any cell calls if you have the Euro Pro 26. 12.5khz does
the job. Do you have the Pro26UK? If you don't, better look around
1000-1020 for cell calls or 340-390 in the NFM mode. Some are on 100-130
on the NFM mode as well. Good luck.

Message-ID: <47l4c6$s1n@newsbf02.news.aol.com>
Source record: 246846

If LAPD decided to switch to 800 from their current 400/500 freqs, new radios would have to be bought. The Astro line of radios can only work in specific bandsplits and cannot be reprogrammed (through normal methods) to work in another band.

LAPD is big enough where they could probably make a case for letting the FCC allow them to do trunking in the 400's and 500's. There's no technical reason as to why it couldn't be done. The Astro's will do trunking and digital and encryption.

1484. AR8000 Audio Scan Option

Newsgroup: rec.radio.scanner
Date: 1995-11-06 00:00:00 UTC
From: fkelcz@facstaff.wisc.edu
Message-ID: <fkelcz.108.000CE995@facstaff.wisc.edu>
Source record: 246847

Tried the Audio Scan option of the AR8000, motivated by wish
to overcome "wandering birdie" problem. This option in the
Expert User mode does not seem to work. To double check
I entered ham freqs into a set of channels and transmitted
a blank carrier from my dual band, in a quiet room, into the AR8000
- scanning stoppeddead on the channel whether the Audio
Scan option was selectedor deselected.

Anyone else have luck with this - does it actually work?

Scanners to put out some RF, but you'd have to be awful close to detect it,
and you would not be able to tell what frequency the scanner was receiving.

Fellow netters,

I just came across three radios and a compatible charger. The radios are Motorola MTX-900. They have a telephone keypad, 6 channel, ABC switch, and have the adapter and secret service ear set, rubber duckie 8" antenna. Also on the side of the radio there is the standard push to talk pad, a private response button and a button that has a telephone head set.

The model number is 673APA0237.

After I charged the radios and turned them on I got a steady tone. I take it that thus means I am locked out and the radios need to be re-programmed.

My questions are

1. Are these radios worth anything?

2. How much does it cost to have them re-programmed?

3. If I trade them or sell them how much are these worth?

4. What would be a good trade for this set?

Any help would be appreciated. I live in the WASH DC area.

Hey homer, need to get your facts correct.
1. It was the FBI not the CIA
2. The CIA's charter does not allow it to operate intel or counter intel missions within the confines of the United States. If I remember correctly, that is the FBI's charter.

You're getting images of cell phone calls. Check your I and multiply by
21.7 or something like that to figure out the real freq.

Your techs are correct. Motorola does market any "multiband"
HTs. I think what "Watergate" was trying to say is that if they
decided to go trunked, they could go trunked on T-band if they
already have ASTRO equipment operating on that band in a
conventional operation.

No. It simply places the receiver on a specified channel and
listens. It doesn't transmit anything.

> How does one go about finding out the keystrokes to place a phone into
> test mode?

You need to know the service password. This is normally reserved
for "factory authorized service personnel". On some Motorola
cell phones there is also a minor hardware mod that needs to be
done.

If you start screwing around with the "service modes" on a cell
phone BE CAREFUL. There are modes that turn on the transmitter
and cause harmful interference. Leave them alone.

In all accounts of what the justice department wants, it has been noted that there will still be a requirement for a warrant to tap a phone. That won't change.

What they want is to increase their capacity. They can currently monitor about 1 in 100,000 or so. They want to increase that capability to 1 in 100. I have nothing against legal phone taps, but I can't see the need to tap so many phones at once.

My beef with this is not so much that they can tap my phone... but that they want to dump my tax money into a system that is FAR bigger than they need. And then when they run out of the money they have allocated, they will make the phone companies pay for the rest of it - which in turn will be on my (our) phone bills.

Correction: the station is located Fort Collinc, CO. Also there is one in
Hawaii. You can here the hawaii time 15 seconds before the colorado time.
Hawaii uses a woman's voice. Colorado uses a Man's voice. Canada has a
station that does the same thing, but they use 3333 kHz and 7335 kHz. the
time is in English and French. Please Excuse my spelling, I am a grad
student who has been studing too long.

Linus Peter Sweers

It is not charity if you are not using your own money. Just because your
mob calls itself a government, doesn't make it legitimate. Gun control
means hitting your target. People who claim that money doesn't matter, are
usually living on someone else's money. Society is a mental construct,
formed by those people who are too insecure too handle the concept of
people as individuals.

Denver/Eastern Front Range/North Central CO Expanded Edition 9502

SCANlist 9502 Volume 7 #9 COPYRIGHT 1995 Phil Mangone. All rights
reserved. Updated 2/05/95 for Denver and the Eastern Colorado Front Range.

Distribution of this list is at no charge and courtesy of this BBS
from the The Metro Comm Center. Use of this on-line publication for monetary
gain or republication for profit without permission of the Author in part or
whole is prohibited.

Updates to this list and other frequency lists are available for download
from The Enterprise BBS @ (303)659-8294 for the Denver Metro area and
(303)785-0217 for the Greely/Longmont/Ft. Lupton area, The King's Market
BBS @ (303)665-6091 for the Denver Metro area and Longmont, (303)225-3491 in
the Fort Collins/Loveland/Wellington area and (303)346-3491 in the Greeley
Area. Please send all e-mail correspondence to me through either of the
above listed BBS systems or the Colorado Scanner Echo Available through
the above listed systems.

Use of this information in the commission of a crime is prohibited
and prosecutable by Local, State & Federal Laws. I do not assume
responsibility for misuse of this information.

Due to the nature of Public Safety Communications frequencies and use
are constantly changing therefore I do not assume responsibility for
changes, incorrect information and omissions. Use of this list is to
enhance one's use of a scanner or similar type receiver.

At the time of release of this file there are no known mobile scanning laws within the state of Colorado. However due to 'home rule' jurisdiction allowed by the state it would be wise to check on local regulation in your area.

I do not encourage anyone to "Chase" calls as you are asking for trouble with law enforcement officials and they will not hesitate to prosecute.

KEY INDEXES AND DEFINITIONS

F-# Short for channel . i.e. F-1 is the same as channel 1.
###.#### S Indicates non-repeater use. Both base and mobile stations use the same Frequency Commonly referred to as "Simplex"
PD Police Department
FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Controletc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems
for "Input Scanning"
IFB Interruptable Feed/Fold Back. TV audio feed for reporters.

NOTES FOR FEBRUARY:

GREENWOOD VILLAGE

All Police comm is on the Arapahoe County 800 MHz system however public works opearations are still on 453.650.

AURORA

On Monday February 6th all of the old PD/FD repeaters were taken off the air and retired. So far there's been no word any applications for those frequencies by other agencies.

LAKEWOOD 800

Still nothing on which system they are in favor of at this time though it is definate they will be operating on 800 MHz in the future.

STATE 800

The G.E. EDACS 800 System listed under the State of Colorado section is very active with comm involving an Ambo-cab type operation which one it is we are still working to identify. The system is operating in "fail-soft" or the "old mode" which all comm originates on one frequency in the trunking pattern until a second group begins using the system and is routed to the next repeater in the sequence. Unfortunately the "G.E. Jingle" is turned on.

COMPUSERVE

This edition is being sent to the Compuserve HamNet file area for nationwide distribution. If the response is favorable future editions will be sent to Compuserve.

J> 20.00 a Frequency

hmmm...
You must have money to burn.
There are a few ways you could get these freqs for yourself.
You might try the direct approach: ask them.
You could beg, borrow or buy a frequency counter, get close to a security
person, kick him, and get the freq while he calls in ;-).
You could worm your way into the security office, as a student volunteer,
and get the frequency off a radio left there.
If you want the frequency *that* bad, go find it. It's never so hard that
I would pay $20 for it.
Why is this *so important*? Planning something??

FL> than $200?

I must be missing something.
Why would you want something like this? Why digitize an audio signal, only
to feed it to a sound card to turn it back to analog audio?
The RF environment inside a PC is hell. The amount of shielding needed would
make the card take up 2 slots, and be very expensive.
A simple hand-held will do this a lot less expensively.
Or, an I missing something?

Icom R-7000, R-7100, Uniden MR-8100, RS PRO 2006 for SALE!

I have one of EACH as listed above. I have boxes and manuals for all except MR8100.

7100 is the desireable version (800MHZ), all are PRISTINE and PERFECT.

7100 has DDI Interface (Cellular Tracking hardware & software)

I also have DDI hardware to convert RS 2006, never did it.

All units are 100% working and function, no scratches, blemishes, etc.

I am posting these for sale as I am planning a career change, job move to the West coast, and don't have the time anymore. I absolutely am looking for the PIE IN THE SKY MAXIMUM amount(s) for these pieces of equipment, as I do not have the need for the money, I just want to travel light.

Worse case scenerio, they get mothballed in Mom's attic for my retirement in 20 years.

Soooooooooo, search high, search low, search wherever you may, but if you want the BEST and you are WILLING to pay TOP DOLLAR, stare at this ad day after day after day, keep looking to find what else is out there, and THEN make an offer. Don't ask me to place a price on what I want, I want the absolutely highest dollar amount, and I have 60 days before I make my move.

Summary:
Icom R-7000, R-7100, Uniden MR-8100, RS PRO 2006 for SALE!
TOP DOLLAR OFFERS ONLY, located in New Jersey
Make offers, don;t ask "How much?"
I'll look over bids, and decide by 12/31/95, UNLESS I AM OFFERED THE PIE IN THE SKY!!

I worked on a Navy project about 7 years ago, and recall
that the deck communication freq's were in the 140 - 143
mhz area. This might work if you are in a port city.

Hope this may be a starting point.

Hi Bill:

Actually, there are time signals in the ranges you specify.
HOWEVER,the signals are DIGITAL, and would require some sort
of decoding hardware and software.

You'd be better off to invest in a reasonable shortwave set.

I don't know the model number but I bought one at Radio Shack a couple of years ago for around $20.It's a magnet mount and I believe it covers the whole freq spectrum for scanners. I have a Bearcat 200 handheld and had to buy an anttennia adapter for the plug on the antennia. It had the standard mobile radio plug on it and I needed the BNC style. I really recommend this antenia I can really pull in the frequencies when I'm in my car.

1525. Looking for frequencies sending CW

Newsgroup: rec.radio.scanner
Date: 1995-11-07 00:00:00 UTC
From: dakidd@cris.com
Message-ID: <dakidd-0711951239020001@192.0.2.1>
Source record: 246786
Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner,alt.radio.scanner

Hello, folks...

I'm a "wannabe" ham (no license, or gear other than a Pro-43 scanner yet) looking to learn morse in preparation for getting my ticket. I've got Gordon West's code tapes, the no-code plus book from radio shack, and "Now You're Talking!" from ARRL. What I don't have is the patience to repeat the tapes over and over and over while I learn the code. I've found that I get to a certain point, and lose concentration due to the repetition, and everything I've learned up until that point just kinda goes out the window. I also find myself "anticipating" the next letter to come along because I've played the tapes so often. I'm not willing to settle for "just" the no-code ticket, so that option is out.

What I'm looking for is the frequency of a station that sends CW (whatever rate...) that I can tune up on my Pro-43 scanner and practice copying from.
I'd love to be able to tune up W1AW's code-practice "workshops", but I simply don't have the gear to tune that low. (30 Mhz is my bottom end with the radio I have)

I'm in Bay City Michigan, and my radio covers 30-54, 118-174, 220-512, and 806-999.9875 Mhz in either AM or FM mode. If anyone knows of a station I can tune up for some copying practice using this radio, I'd like to hear about it. And yes, I know: Trying to use a scanner as a ham receiver is nuts. When I can afford to buy a "real" Ham rig, I will, but for right now, "Use what you've got" is the catchphrase for this boy...

Email responses preferred if at all possible.

Thanks in advance...

There is no such thing. NiCads are Nickle-Cadmium rechargable cells.
Lithium cells are high capacity, non-rechargable batteries. Lithium
batteries are available everywhere; they have 2 to 3 times the capacity of
ordinary alkaline cells in many applications, but are more expensive, and
are not rechargable.

==American both are spaced at a default of 12.5khz in this range. You
==will not miss any cell calls if you have the Euro Pro 26. 12.5khz does
==the job. Do you have the Pro26UK? If you don't, better look around
==1000-1020 for cell calls or 340-390 in the NFM mode. Some are on
100-130
==on the NFM mode as well. Good luck.
=

=How can 12.5kHz do the job when 30kHz are required? You will only hit
one
=cellular channel every 150kHz (only hitting one in five channels, with
10x the
=number of potential "stops" as compared to a proper 30kHz scan).
=
=Using 5 or 10kHz steps at least lets you hit EVERY cellular channel
along the
=way.
=
=Figure it out first...
=
=Steve

Because, dork, the cellular call transmissions use enough bandwidth to be caught by a scanner at 12.5khz, especially one with a not very selective front end, which is true of almost all of them. Check before you criticize.

Maybe it's because I am by nature a curmudgeon, but this kind of post really pisses me off. If you want to sell this stuff, let's not be cute and blather on about getting the top dollar. Post a price, even an high one, but give a prospective buyer an idea of what you're looking for. Of course, this assumes that you're even serious, which is certainly questionable.

I was under the impression that the case against Larry Gass was a
CRIMINAL case in which he was accused of divulging "private" radio
transmissions TO HIMSELF by listening to them. Part of the argument was
that trunked radio systems are somehow like spread spectrum radio
systems, and that they therefore might be protected by the ECPA.

I was under the impression that (a) everyone knew the difference between
a trunked system and a spread spectrum system and (b) that a federal
court had ruled that it was only illegal to divulge radio traffic that
was also protected by the Wiretap Act.

It appears that the rapidly changing political climate may render me
wrong on both counts.

Hello to all-

My company has authorized me to spend about a thousand dollars on scanner gear for our Emergency Operations Center.

While I have some older scanners (BC760XLT, Pro-2006 and my newest toy AOR8000) I'm out of touch with what is the lastest and greatest gear since my daughter was born.

I'm looking at getting 2 or 3 desktop scanners, all must be capable of monitoring the 900mhz SMR band and 1200mhz HAM band.

OPINIONS?

Greg Reid

Have you tried another antenna? Take it into the store, ask to
borrow an antenna from a radio on display and see if your unit
works any better. If it does, then you broke the antenna.

If it is the antenna and you don't mind a longer one, you might
try finding a ham radio store and asking about the Diamond RH77.
It pulls in things that the stock duckies can only dream of.

The best bang for the buck is probably still the PRO-2006, if you can
find any.
They are still sold in Canada, and many people just have them imported to
their homes. A real good point about the '2006 is that $3000US will
still buy 3 of them!
Newer gear is also more expensive, and if the older stuff will do what you
need, why pay for the extras you'll never use?
Bill

I own a Bearcat/Uniden 890XLT that only required moving a resistor to allow the CPU to access the 824-849 and 869-894 ranges. The resistor that has to be moved is surface-mounted; even with a decent soldering pen it was a tedious task.

The BC890XLT is not a wonderful performer as far as reception goes. It balances the lousy specs with neato-gizmo bells and whistles and 100 ch/sec scan and search.

Someone I know just purchased a new BC890XLT from Communications Electronics and despite all the crap about the 890 having "a new CPU", we unblocked the unit with no trouble.

Think of radio (not just AM/FM, but ALL two-way radio) as the
Internet of days gone by. Now, let's say you could LEGALLY tap
into Internet routers across the country without anyone noticing.
Pretty cool idea, isn't it?

Those flashing lights down the street?
"Bridgeview Fire, send another ambulance to the scene!"

Should I try to go the the concert in the blowing snow?
"895 to base, I'm going to make another pass down Route 45 just
to make sure the road stays clear."

Neighbor gossiping behind your back -- on a cordless phone???
"Linda, Andrea would go Postal if she knew I told you this..."

There's 24-hour weather, police, fire, amateur radio, phones,
detectives, local businesses, the McDonalds drive-through, and
more. The best part is that your "airtime" is absolutely free.

The best entry-level scanner I can suggest is the Uniden/Bearcat
350A. You don't need a book to put all the freq's in it; there
built in. I own four scanners, but I use the 350A the most
because it is simple and it really works well.

I live very close to a cellular tower and I receive cellular call images anywhere between 435 and 512 MHz on a non-800 MHz radio.

Cellular calls have a distinct 6 kHz carrier tone that is unmistakeable (once you've listened in on the real 869-894 cellular band).

1555. Re: Cellular Scanning

Craig is correct.

Furthermore, if you own a scanner with high selectivity like my Regency MX-7000, the 12.5 kHz step just doesn't do the job. I have to switch my scanner to 5 kHz step to make all of the calls audible.

>Anyone using one??
>If so, what model and is it worth it???
>Thanks in advance.
Hi,
Found my RS discone very poorly engineered. Seems that the stanless steel
radials screwed into the unit using chrome plated _brass_ screws.
Touch the radials and they break off.
I trashed my antenna after RS replaced radials and the new ones still used the
brass screws to connect to main ant. shaft.
IMHO, Groves scanner beam or the Antenna Specialists (or both coupled
together) broadband omni are two of the best on the market. Do use a good
preamp if you are away from a major metro area.
Hope this helps.

Is it possible to track/find/confirm that someone is monitoring a given frequency? Of course it is.

Could the FBI tell if you were listening from across town? Nope.

Could they from across the street? No problem.

This story could be completely bogus - but it is indeed possible to do.

Cases in point:

The British Post office (which is in charge of radio-related matters in the UK) can tell if you are watching TV from their van out from of your house. If you haven't paid your yearly TV license, watch out!

The OPP (ontario provincial police) use "radar detector-detectors" to nab people who are using radar detectors on Ontario highways. (the detectors are illegal in this province).

It was demonstrated to IBM big-shots that computer monitors could be "read" from a van parked out front of one of their buildings. An IBM building in Toronto has a faraday cage built into it now as do most new ones no doubt.

Whether the FBI really did corner this fella is debatable if you were not there yourself but I suspect they have access to equipment that would make this possible.

If you want an explanation of how this works, let me know.

Cheers!

Andy

The officials use condenser mikes to announce the calls. These mikes
can be heard on the VHF TV frequencies, so a TVsound-capable radio
will do in this case. I have no frequencies for the Bengals or
Riverfront Stadium however.

1563. FS: MVT7100 at new low price!

Newsgroup: rec.radio.scanner
Date: 1995-11-08 00:00:00 UTC
From: wally@msn.com
Message-ID: <47qjfc$k4n@calliope.wln.com>

The CATV operators can also tell what you are watching. They use
the information to help detect non-subscribers pirating service
or even paying subscribers that are getting programming they have
not paid for.

I haven't heard of this being done lately. But I had a neighbor
that stole cable service (just went out to box in his driveway and
hooked it up). Several months later it was disconnected. A letter
was left on his door that from the carrier that he was discovered
through an electronic "audit" of the neighborhood. Later I was
told by a cable company employee that they had hired a contractor
to "sweep" the city for illegal connections.

It sounds like he wants to know _what_ he might be hearing. There
is no cellular in the low 900s.

There are trunked and conventional two way systems in the 900 to 901
area (PLMR). Some of these systems may have full duplex capability on
both ends (repeater and mobile) which would make them sound like
phone calls. Ham radio can found in the 902 to 928 range (though
not many hams use it) 902 to 928 is also where unlicnesed spread
spectrum devices operate (you would not hear that with your scanner).
And the primary user of 902-928 is the government (who knows what
they do there - although some of it is airborne radiolocation).

If you are hearing cellular - it's likely an image. "bounced/
skipped/ or echo" - I am not sure what that means.

Source record: 246740

Actually, this is theoretically possible with sensitive enough equipment. When a radio is tuned to a particular frequency, it will tend to oscillate at that frequency. It will also emit some degree of EMI or radiation that is tuned to that frequency. This is exactly the reason you are not allowed to operate radios on airplanes. Thus, it is possible to tell what frequency a receive only radio is tuned to.

An example of this is in Britain one must pay to have a TV set in their home. The authorities actually drive around in trucks with equipment measuring radiation from homes and nailing people who haven't paid!

On the other hand, the feds aren't just going to pick you out of the blue to monitor what freqs you are listening to. They would have to have some reason to single you out (this is not because of regulations but simply because there are too many people in the country!), so you are relatively safe from this type of detection. Besides, this type of equipment costs money and is probably not standard issue.

Regards,

Veech

Source record: 246744

I am thinking about getting a BC3000XLT. But I just got Grove's new catalog today and saw the PRO-26 for $50 cheaper. Both are made by Uniden right? Looks like the '26 is missing a few freqs besides the cell band, but nothing really too important. Scans 50 ch/sec wheras the 3000 scans at 100 ch/sec. The PRO-26 has half as many channels, although I probably wouldn't fill up 400 channels anyway. I was counting on the BearCat's 1005-1030 for cellular. Does anyone know if the PRO-26 receives images there as well? How about performance? Is the 26 as bulletproof as the 3000? Any info appreciated...

Anybody got any info on Future Scanning Systems, formerly of Bartlesville, Oklahoma?

A couple of years ago they marketed an interface for use between Amiga computers and Icom Radios. It was a hardware/software package which started at about 150US, with a version which allowed for 2 radios to be hooked up for 25-30US more.

Would appreciate either a post here, or e-mail from anyone who either knows if this company is still around (I do know the old phone nbr is no good) or might have one of these units still kicking around and wanting to sell it.

Tnx to you all, es gud listening.....Bob, near Williamsport PA

Source record: 246752

No, it really is against the law to listen to cell phones. According to the FCC Field Engineer in know, he was only aware of one case involving someone getting busted for monitoring cell phones. In this case some lawyer was monitoring the cell conversations of another lawyer (and I guess using this information). The FCC went in with U.S. Marshall's (as they do in almost all enforcement actions requiring big guys and guns). Specific charges as usually up to the local US Attorney and in this case, the guy was charged with a civil rights violation, rather than a ECPA charge.

The law is interesting since so many people disregard it, but with TDMA and CDMA comming down it probably won't be a problem too much longer. Public airwaves have never been restricted from monitoring in the past. What if the government suddenly declared it was illegal to watch channel 13 on your television? The main problem I have with ECPA is that the cell industry basically bought it from Congress but I should not be surprised when out government is controlled by foreign lobbyists, PAC (Political Action Committeess and SIG's (Special Interest Groups). One last thought, the FCC Field Office in Houston, Texas is scheduled to close in summer '96, who will take care of the ECPA (and interference complaints then) ???

In GOD we trust, all other's we monitor

Regards,
Billy

>communication and is therefore a protected segment of the ECPA.

Not to pick nits, but we need to distinguish between 'rights' and
'authority'. The government operates under the 'authority' of the laws.
You, the citizen, have 'rights', not because the government decided to
give them to you but because you were born. The constitution lists some
of those rights in the first ten ammendments because the people who were
about to form the U.S. Goverment were well aware of the potential abuse
of authority by government employees.

You have the 'right' to know what your government is doing and the ECPA
merely recognizes that right, it does not confer 'authority'.

How could they prove you told yourself? Plead the 5th. This is the most
rediculous thing I've ever heard.

1588. Ham Radio Liciense Question..

Newsgroup: rec.radio.scanner

I have a comment to make i have an old RCA black and white
with uhf capability (I think) I set my channel and U
then tune into channel 79 I sometimes pick up the local
police dept. Great yah but it is not a clear signal
can someone outhere let me know if there is a way of
increasing the signal. I think i need a bigger antenna..
well if anyone knows, let me know..

Angelo..

Cable TV companies here also use it to count the number of TV's on a cable drop to see if anyone taps-off
more TV's than permitted.

I replaced the standard rubber duckie on my pro-62 but the new one with the ribbed feel doesn't intercept stuff in the basement whereas the old one worked until i bent it and i think it broke.

I think I broke my rat shack pro62 scanner rubber duckie, the standard one. I went to rs and they replaced it with a longer one which is ribbed. i believe this is a cb antennae but im not sure.

they said that each model has a specific antanee for it. Is this true? why? the new antannea cannot receive stuff inside buildings and basements. i never had any problems with the old antennae even inside the basement of my office.

i have a lot of interefence too

can you tell me what's wrong? i bent really hard when i had the scanner on the belt clip and it bent. could this break it?

tx

From what I understand the laws have changed on how many tv's you can
connect to your cable. Our local company used to charge extra for
each tv connected. Now they have no say whatsoever on how many tv's
are hooked up and cannot charge more than a basic rate + prem
channels.

I don't really think it was the antenna. The PRO-10 had a pretty sh-tty input design where the ant lead was soldered to the top of the bend on a resistor. That series is notorious for "loosing" it's sensitivity even though the ant is good. What happens is that the solder joint usually cracks. This is either from abuse (normal wear and tear for some) or a cold solder joint from the factory.

I haven't been inside the PRO-62, but it may have a similar problem. If you bent the antenna that far, it may have damaged the RF path in the unit. The salesman (read "idiot") should have checked the internals, or had someone who was qualified do it. Some of the R/S staff are pretty good, but they're also far apart and few between. I stood and watched one salesman sell a young guitar enthusiast 10 feet of solid core RG-59 and two 1/4" phone plugs for his guitar to amplifier connection. Neither the R/S idiot nor the kid would listen to me. Oh well, it's his problem and yet another disatisfied customer.

(side note for those who want to know, a solid core cable or wire will quickly break after enough bending and twisting.)

Funny, I patched my PRO-43 into a Spec Anal and found that the 1st L.O. pretty much tracked my scanner's operation. I forget what the offset was, but it was a firm track.

For any of the paranoia freaks out there, the power out (leakage) was on the order of .1 - 2 mW at the antenna terminal, using RG-58. This means that the connection was pretty much an IDEAL LAB CONDITION. It would be difficult if not impossible to sort through all of the hash and mash just to track down a scanner. The RF world contains a GREAT deal of garbage. (no offence to the HAMs, but 'yall know what I'm talking about!) :-)

: EFc> Security for digital cellular telephones is very good. E.G. GSM uses A5
: EFc> algorithm to scramble the data, and other e.g. A7 for crypting the A5
: EFc> keys etc.

: Can you help me to find A5 and A7 algorytms please.

: Alexey

A5 (40 bit stream cipher) and A7 are both confidential to the GSM
group. There was a posting awhile back in SCI.CRYPT about A5 cryptanalysis.
They had an aledged version of A5, but I'm not sure if it was correct.
In short, I don't think that you will be able to get hold of the algorithms,
and even if you do then you won't be able to break them without significant
processing power and certainly not in real-time.

John Wigley

Hi Greg,

Checkout some of the newer radio shack desktops, looked in there
catalog tonight and there seems to be a new line with some fancy
looking ones. I have had good luck with the Radio Shack scanners, as
well as the other brands. IF you get it at Radio Shack see if you can
get an open exchange policy, talk to the manager.. Which one of our
local eoc's were offered if they bought a 2m mobile there..

What is your call and where are you located??

>)so many simultaneous taps? Sounds very Orwellian to me.....
>
> It is positively tyrannical. It violates the Federal Constitution, and
> the Constitution of every state of the union, being unreasonable search,
> and without a warrant or a judge.

Before doing the Supreme Court's job for them, you need to avail
yourself of all of the facts that they will have.

1) The FBI is requesting changes to telco hardware and software that
will allow the capability of simultaneously monitoring 1% of all phones
connected through each central office, instead of the part-of-a-percent that
is available now. They are not proposing to begin randomly monitoring that
1% just because the equipment would be in place.

2) The FBI's proposal says nothing about eliminating the warrant
requirement for wiretapping. They want the ability to carry out whatever
taps are authorized by the warrant(s), which they can't always do
simultaneously with the telcos' present setups.

If you (meaning every citizent, not just Mike) want to protect your
civil rights, you must first be aware of exactly what they are. This
includes knowing the case law that interprets the Constitution, as well as
the special rulings made in your respective states.

Your local college may offer a credit course in Constitutional Law.
It is VERY interesting to study.

It seems that the only way a person could get in trouble for monitoring cellular frequencies would be if he told people he was doing it or divulged information he heard. I've never heard of a law enforcement agency that is able to detect illegal monitoring by some electronic means. I guess they might be able to detect it somewhat if they bugged your living room.

Message-ID: <47tkkf$ll3@frodo.smartlink.net>
Source record: 246696

Hi,

I have a pro-43 and a pro-2006 for sale that are in mint condition.
both have manuals and original boxes. The cell and speed mod
has been done to the 2006 and the cell and FM mod has been
done to the 43. Both work great. I have other hobbies that take
precedence money wise so I have to part with these radios.

I am asking the following:

Pro-2006 $300 + shipping

Pro-43 $250 + shipping

Both are firm prices. The 43 also has the neoprene case that
became famous around here a year or two ago. I have the service
manual for the 43 as well. Please send me e-mail to:

tcarnes@smartlink.net

if you are interested in picking one or both of these up.

Thanks

Todd..

It's unconstitutional in what way? All they've done is ASK for the $ to
set the system up. This is in no way unconstitutional.
It was also not said at all that they would place a tap without a warrant.
It would appear that you need to slow down and read what you read.

We would *all* do well to keep an eye on this, of course, as it *can* be a
great temptation to re-vamp the system into something the framers of the
constitution never intended, for example, "carpet bombing" warrants.

Source record: 246712
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone know if these allocations are totally correct?

Cellular Frequency Allocations
869.040 - 870.000 RCC - Voice Channels 800-832
870.030 - 879.360 RCC - Voice Channels 001-312
879.390 - 879.990 RCC - Data Channels 313-333
880.020 - 880.620 Telco - Data Channels 334-354
880.650 - 889.980 Telco - Data Channels 355-666
890.010 - 891.480 RCC - Voice Channels 667-716
891.510 - 893.970 Telco - Voice Channels 717-799

Mobil cellular telephones transmit 45 MHz below the base (tower) frequency (824.040-848.970) and the mobil side is normally retransmitted by the base (tower) unit. Channels are 30 kHz apart.

(Channels 800-832 are also identified as channels 991-1023 on some systems.

I think you're right. This has to be the FBI, because the CIA is not responsible for domestic affairs and crimes unless they affect foreign affairs. And besides, there are other facts left out, like having to have probable cause before a warrant is issued by a judge, etc.

Sure the guvment could detect scanners if they really wanted to. Hav'nt any of your guys ever heard of "TEMPEST" (an acronym for Transient Electromagnetic Pulse Emanation Standard). This is a US government standard basically dealing with the EP emmissions from computers, i.e. you can't work with a classified document on a "standard" PC because someone could sit outside your office in a van and decode the EP transmissions the "Non-Tempest rated" computer gives off and read the document. Certainly the same basic technology could be applied to any radio system using an IF. If certain agencies wanted to monitor what foreign agents were listening they might spend the $$$ to mature this technology but I doubt anyone is going to do it because some kid is listening to the FBI or even cell phones. After all, it is still legal to listen to the FBI, DEA, ATF, etc... (for now!) Any other thoughts ???

For Sale

One Icom R-1 Scanning Radio
(100kHz to 1300mHz - Unblocked)
Includes:

3 BP-84 (1000mHa batteries)
1 BC-72A (Drop-In Quick Charger)
1 CP-12 (12 volt auto cigarette lighter adapter/charger)
1 LC-61 (Carrying Case)

The R-1 is excellent for covering 800 mHz+ with it's selectable channel steps, multi-mode operation and sensitivity. This radio system only has a few hours on it. Contact for details if interested. All items have been are in original packaging and boxes and include all accessories and instructions. Please post or contact direct with serious offers.

1641. Mods for Icom IC-736

Newsgroup: rec.radio.scanner
Date: 1995-11-09 00:00:00 UTC
From: yingst@knighted.com
Message-ID: <47u4cf$les@crier.knighted.com>
Source record: 246716

Does anyone have any mods for the ICOM IC-736? I'm looking for a way to
turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna). I'm also looking for a way to
improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.
With the notch filter ON the audio sounds a little better,
but it still could use some improvement.
They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).
I had a IC-737 that had the same problem with the audio,
just not sounding quite right. I am also interested in any other mods
for the Icom IC-736. Please send any replies to yingst@knighted.com Note:
If you post a reply into this newsgroup I proably wont get it,
my internet provider only holds news for 1 day. Thank You. Harry

That looks like a Motorola serial number to me. The model
number likely starts with "H"

[snip]

Doesn't even need to be a computer... Electric typewriters give
of a unique EP signature for each key. We had to have special
rooms for typewriters used to create top secret documents.

PerCon provides frequency databases on CDROM. Our Winter 95 release of Spectrum starts shipping Nov 17th. It allows searching by frequency, frequency ranges, callsign, radio service code, city , county and company name. The latest release also supports the Opto Scout. The cost is $29.95 plus $7.50 S&H for over 3 million frequencies. You may view,print, or export to a UFDBF.

> "Police Call" any feedback would be appreciated.

I'm with breeze@gulf.net on this one. The response from Andy Moss indicates that people can detect when an electronic item of a particular type is in use. That's easy... we have radar detector detectors here the US too. And the cable guys put a beat frequency on the line to trace if your set is able to receive it... etc. That stuff is easy to do. But Andy goes too far to alarm you.

The hard part is being able to detect, from a distance of over a few inches, much less yards, precisely what frequency you're tuned to on a scanner radio. That requires two things, a knowledge of the exact IF offset in your scanner (usually 10.7 or 10.8 MHz and 455 KHz for dual-conversion units) and the ability to detect a specific, extremely low-power intermediate frequency being output from a little-bitty transisitor in your scanner unit.

Say the scanner is tuned to 150 MHz and the IF offset is 10.8 MHz. This would mean that someone would have to be able to detect a very faint carrier at 160.8 MHz. If you were scanning, this frequency would be hit upon irregularly for about 1/50th of a second unless there was an lock-in at 150 MHz.

The FCC requires that the output of the IF and the harmonics be SO LOW that they cannot interfere with other devices in certain ways at certain distances.
The odds of someone more than a few inches away detecting your scanning frequencies while you are actively scanning channels would be astronomical! Besides, why would the FCC care what you were listening to? They haven't got enough budget to investigate the real problems.

Okay, Linus,

Why is Hawaii 15 seconds ahead of Fort Collins? Faster atoms in the heat
of the islands? Slower radio waves in the Pacific ocean? What's the scoop?

I get CHU Canada at 7335 MHz much better than either of the others. But
I'm in Kentucky, too.

Try your local NOAA weather channel. I don't know if they all operate the same, but the one in Denver (162.55) periodically announces the time from WWV. However, you can't tell when it's going to happen, and when it does, it's at whatever time it is, ie., 10:47:35, not 10:47:00 like the broadcast WWV. Of course, it's lucky that 303-499-7111 is a LOCAL call! On the other hand, good luck getting through on Daylight Savings days..

Oops I goofed, the voice is 15 seconds earlier, but the beep that
signifies the top of he minute is the same. Sorry about that.

As for the reception, It really depends on a lot of variables. When I was at Virginia Tech I picked both up clearly. A good antenna is one of these variables.

JG> As we all know, there is plenty of stuff going at 800 MHz besides
JG> cellular.

True.
However, ICOM has no problem thinking that people will buy them, because people *are* buying them.
It helps to realize that the ICOM R-7100, for example, is not in the same class as a PRO-43.
It does much more, at a higher cost. Using one as you would use, for example, an AR-3000, is a waste.
The '7100 shines at finding new active freqs, while, at the same time, scanning the local public safety band, for example. Try *that* with a '2006.
Of course, the '2006 is a faster scanner, and costs less.
The ICOM scanners (communication receivers, whatever you want to call them) are simply not the same thing as the usual scanner. They are designed to do a different job. And people who want to do that job will buy them, even with no 800 MHz, regardless of what *we* think.
I like mine (older, full spectrum model).

)
)I'm new to scanning and just picked up my first book, radio shack's
)"Police Call" any feedback would be appreciated.

I have no idea whether what your friend described actually happened, but
it is certainly the case that a scanner can be detected, and the
detector know what frequencies are being scanned.

)No, they cannot "trace" scanners. At least not easily. I guess in theory

They certainly can "trace" scanners, if by "trace" you mean detect that
one is in operation nearby, determine what frequencies it is scanning,
and determine its physical location and follow it if it is moving.

If you mean determine what make/model and where purchased, then I agree
that it cannot.

)a given scanner type may radiate a slightly different signal (called
)"Birdies", and every receiver has them) depending on what frequency was
)tuned...but I wouldn't count on the FCC being able to deal with
)that...now the NSA on the other hand....

>6:30am EST.

Hi, yourself.

I used to faithfully listen to the Steve and Gary show before the LUP went sports. I especially liked the way Steve Dahl would obsess on a single topic. This was especially borne out one day when I had the program on my car radio on my way home from work and Steve was musing about what John Wayne Gacy might be having for his last meal. The next day, when I turned the LUP on at the same time, he was STILL TALKING ABOUT IT!

I don't know why Gary left. For answers you might better try the newsgroup rec.radio.broadcasting. Also, WLS personality Jay Marvin is on this group a lot, and he has lots of inside info on Chicago radio personalities. Maybe if Jay doesn't check in soon, some helpful soul will give you his e-mail address and/or WWW page address. If you find out why Gary left, let me know as well.

: BN> Yep, and Andy is wrong about TV antennas to boot. My tower mounted
: BN> yagi shows very distinct directional patterns, and you don't get
: BN> them with a unity gain antenna.

I didn't even see this post so I can't really comment. It just looks like someone with the initial "BN" is trying to slag me. Not to mention, I see no data to backup his claim. And his comment about a unity gain antenna have no directional characterstics is misleading and not entirely correct.

: Years ago, in Centerville TN, I used a corner reflector VHF TV antenna,
: as a beam with a scanner. Comparing it to a 1/4 wave antenna, where I
: could hear 1 weather station, the beam picked up 3 different weather
: broadcasts, dependent on which way it was pointed.

: Sounds like gain to me. (G)

Wrong, Blake. The only thing this proves is that your TV antenna had gain over what you refer to as your 1/4wave (or it proves that your 1/4wave antenna had negative gain with respect to your TV antenna). If your TV antenna had 0dBi then your 1/4wave had -XdBi. It doesn't prove that your 1/4wave antenna was even working properly - or was even pruned to 162Mhz. It also doesn't prove that the bulk of the signal on your TV antenna was even coming from the antenna itself. You've given no reference at all so you've proven nothing. This was my entire argument with the Fido crowd.

Have you ever wondered why QST doesn't allow antenna manufacturers to advertise gain claims? It's to protect people like yourself.

Cheers!

Andy

BTW..... Cable companies here don't use a van parked out front of your
house on the street to see how many tv's you have hooked on cable. They
test the amount of drain on the system coming from your house, by testing
the actual cable. The more tv's you have, the bigger the drain.

1672. Re: How's Kansas City's New Truked

Newsgroup: rec.radio.scanner
Date: 1995-11-09 00:00:00 UTC
From: rdavis@nyx10.cs.du.edu
Message-ID: <47st4j$rlr@nyx10.cs.du.edu>
Source record: 246780

Reports in the Kansas City Star indicated huge problems with the
new radio system. Mostly, in large buildings, the radio vendor was
being forced to install local repeaters (in each building) because
the 800-mhz hand held radios could not talk to the network.
There has been nothing in the last month or so, but
Kansas City seems to still have lots of problems with the
new system.
So far, they have only tried it (for real) with the fire department.

Check: http://www.mich.com/~eddy/works/

AR8000 ToolKit is a nifty shareware program from EddyWorks (a subsidiary of
The Eccentricity Group) which allows you to use your Macintosh to program your
AOR AR8000 scanner exactly the way you want it -- without having to use
dials and tiny keys! In addition, it allows you to access areas of the AR8000's
memory that are not available from the keypad, such as the 'Auto'-mode bandplan
table. Of course, it also allows you to enter and edit bank information
(including the seven-character frequency tags!), print frequency lists, and
much more!

Source record: 246638

I bought one at a Pawn Shop.. I couldn't belive it when I saw it..
Somone obviously didn't know what they were worth..

anyway.. I've called and ordered a manual.. and a belt clip from Radio
Shack cuz the radio didn't have any of that when I bought it.

So I'm going without a manual and have a few questions:

what is H/S S/S is it high speed low speed?

What is RVW key. and how do I activate it?

I think I have most of the rest figured out..

When searching .. you can press limit and it will change from a resume
search to a hold key.

Before entering a frequency that is at a diff step.. you first have to
change the step and then enter the freq. like to enter 165.2375
you hit shift and hit step until it goes to 12.5 then hit shift again to
lock it in place then enter the freq like normal.

Is there any other belt clip than the stock one? I'm betting it's cheap
plastic.. it was only 2.95 from factory parts.

The Weather Service radio stations are starting to broadcast packets of digital data as part of their broadcasts. I asked about this, and got pointed to a company, Dataradio, which sells the equipment to generate and receive the signals. They sell a receiver for $535, which is a bit higher than a Radio Shack WeatherCube :-) that outputs to a parallel printer port or to RS-232 serial. Sez on their brochure that the broadcast uses 5100 nominal baud, and VSK (VSK? what's that?) modulation.

Yep, and since LAPD just bought thousands of new Astro's in the 400 to 500 range and since they fought so hard in Congress for the frequencies they presenlty occupy in the TV band I hardly think they would switch now.

I've seen several messages here to this effect and wonder how they got started. Two years ago I was in Santa Monica at radio meeting and the Commander of LAPD's west division was there and showed his brand new Astro radio to everyone and said every officer would soon have one and he fought for the new frequencies. So either he was an imposter or it was a dream or rumors are started without knowledge or basis.

If you're in Canada, there's a site http://www.com-west.com .

The prices are a little cheaper than ordering from Opto-electronics,
especially if you include Customs charges and exchange rate.

> the detectives call in. Real authenticity there! Anyway, any info?

Others may be able to give you a better explanation of the history, but
it goes back to older radio system, and particularly CW/Morse code
trasmissions. Basically 'K' is the abbreviated way of saying "I done
with my message, go ahead with your message" or. more succinctly, "Switch
to send."

Of course, many of the NYPD officers like to just add a "K" in everywhere
normal conversation would have an "umm" -- as in "xxx to Central. K. 80 the
responding units. K. 10-90 X-ray. K." instead of "Central from xxx. 10-80
the responding units. 10-90 Code X-ray. K."

(That's cancel the responding units, unfounded for those not familiar with
the NYPD 10-code, not to be confused with NYC*EMS's or FDNY's 10-codes.)

1693. Uniden BC-100XLT 200XLT replacement batteries

Newsgroup: rec.radio.scanner
Date: 1995-11-10 00:00:00 UTC
From: adamld@atl.com
Message-ID: <1995Nov10.165612.28655@atl.com>
Source record: 246651

The NiCds in my 200XLT battery pack died (they no longer hold a charge; there's a fuzzy growth on the ends of some of the cells in the pack). I found that Digi-Key (electronics-by-mail company) has a custom replacement pack for the 100XLT and 200XLT. The nice thing is you don't have to pay the set-up charge for a custom pack if you know the "we've done it before" catalog number:

P236-Q074-ND US$31.73

If you mail them the order they'll pay postage.

Digi-Key 800.344-4539

(std disclaimer applies)

In case it's not clear from the above, what you're getting is a cluster of batteries held together by shrink-wrap. You unsolder the existing that's inside the radio's battery pack and solder in the new one.

In my humble opinion, the best omni-directional antenna available, for the money, is the Monitenna, from Channel Master. It resembles a Scantenna, but is built to withstand the elements, better. It's available for 39.95 from Amateur Electronic Supply at 1-800-558-0411, and includes 50 ft. of RG-58.

>all mods possible for this rig.
>
>Thanks!!!

If you replace the 400khz ceramic resonator on the clock circuit with an 800khz, you will (a little) more than double the scan rate.
However, there are three other changes:
A) It cuts the light timer in half (light stays on for about 10 seconds).
B) It cuts the delay in half (About 1 second)
C) The scan rate is sooo fast that the bank indicators do not have a chance to blink. (Therefore they can only tell you which banks are enabled, but not which one is active).

IMHO these slight drawbacks are far outweighed by the increased speed.

Ron

P.S. As far as mods for this rig, I know of:

1) Cell restore (Simple)
2) Battery life extension (Simple)
3) On/Off switch for display light (Moderate difficulty)
4) Speed increase. (Simple/Moderate difficulty)
5) Earphone audio improvement (Simple)
6) Channel Increase (Major hack job).

Does anyone know of any others?

Source record: 246663

I've got both scanners. If you have ever owned the BC100XLT or
BC200XLT then you'll enjoy the BC3000XLT. Much easier to program than
the Pro-26
and the Bearcat does receive the images better than the Pro. I enjoy
both of them but the BC3000XLT is my most favorite. The Pro does have
a few better features but not enough to sway me. The BC is built a
little
tougher too. Happy Scanning !!!

They are very limited on recieve bellow about 140Mhz. This can be corrected by adding a 4' cb antenna to the center conducter at the top of the radio.
Greatly improved my low end recieve without affecting the higher frequencys.

: the detectives call in. Real authenticity there! Anyway, any info?

Actually I just found this out myself. A buddy of mine who is a cop in
NYC said it is simply a way of acknowleging the end of a transmission.
Instead of saying "Roger" or "Over" they say "K"

JSK> Has the system been implemented yet? Any problems with it's coverage
JSK> (they've got to cover a HUGE area). How have the citizen groups
JSK> reacted with respect to not being able to monitor?

Ericcson has sold them a system so bad, that the firefighters have
petitioned the city council, demanding the system be pulled out, and the
old Motorola trunked system put back in.

The system really bites. Typical of Erricsson now a days. Junk.

... Catch the Blue Wave!

AM> I didn't even see this post so I can't really comment. It just looks
AM> like someone with the initial "BN" is trying to slag me. Not to
AM> mention, I see no data to backup his claim. And his comment about a
AM> unity gain antenna have no directional characterstics is misleading and
AM> not entirely correct.

Well, according to the ARRL (and I'll take their word for it over Andy's), a
TV antenna (otherwise known as a Log Periodic Dipole Array, or LPDA for
short) exhibits a gain of about 4.9 over a similarly-positioned half-wave
dipole.
...
AM> Have you ever wondered why QST doesn't allow antenna manufacturers to
AM> advertise gain claims? It's to protect people like yourself.

No, it's not. It's specifically because so many antenna makers use
non-standard methods to measure gain.
For example, one might say their antenna offers X gain, while another maker,
with the same design, claims X+2 gain. Same design, differnt claims. Why?
Because one compares to an isotropic dipole (which is very rare in reality),
and the other to a real-world dipole.
Just like, here in the US, horsepower figures are not allowed to be given
for cars, in ads.
Instead, the HP figures are given for engines (The Super Belchfire XCL has a
1.4 bushell, turbo-inflated, double-overhead corncob engine with 285
Horsepower, while the Namby-Pamby Double-Ply 120 has a 4 quart, single
rotor, perfume-fed engine with 12 HP.) Since the engines are all rated on an
engine dyno, the comparisons are valid.
Antennas are not so rated, so claims vary greatly.

NEW CORDLESS PHONE FREQS

****

BUT DON'T LISTEN, ITS AGAINST THE LAW

F.C.C. has designated a new set of frequencies
for cordless phones to relieve the overcrowded
46-mhz band. Apparently the 900-mhz phones are
not catching on because of the increased expense.

WARNING....It is a violation of federal law to
listen to these frequencies, so block them out
on your scanner. It will be a few months before
they become active.

I punched in Hartford Cityin my Percon Lite data base all I I had
listed seemed to be colleges This is probablly is not what you want.
University
39.82
462.65
Trustees of Trinty College
89.30
Hartford Bord of Edu.
89.90
Trinty College
464.575
469.575
Is this school in Hartford City Limits? Give me the name of the
County & I will do a county wide search.
Another way is try to get a look at the back of one of the units
most Walkie Talkies have the freq written on the back.
Or it may just be a Dot/star Gmrs paried walkie talkie
If you want the gmrs freqs I'll email you an attached file with these
if you want.

>for Apple Valley, Eagan and Burnsville PD/FD's?

Wow! What a surprise to get on here and see someone looking for freqs
from my "hometown" (I graduated Apple Valley Class of '82)

Last I knew, Rosemount was using the Dakota County Sheriff frequency at
155.595, Apple Valley was 155.415, Burnsville was 155.565...or was that
155.655 and Eagan was 154.785. This is from back when I lived there, so
these may have changed...but not bad for a guy that's been out of the
area for a long time, right?

When I was in high school one of our local amateur repeaters was getting keyed up every few seconds and sometimes the interference would keep the machine up for several seconds. It turned out that the source of the problem was a Bearcat scanner with a loud local oscillator several miles from the repeater. The repeater input was 10.7 MHz below the frequency of the city service department, and whenever it would stop on that frequency it would bring up the repeater.

This includes knowing the case law that interprets the Constitution, as
well as the special rulings made in your respective states.
>
> Your local college may offer a credit course in Constitutional
Law. It is VERY interesting to study.

1. 1% of all CONNECTED telephones equates to nearly all simultaneous
conversations. You're correct about the fact that they haven't
mentioned WHAT or HOW they will do when they have this ability.

2. Digital telephone conversations can be easily monitored NOW, so the
claim that digital equipment prevents monitoring is a scam for fools
like yourself to believe. Besides, having warrants doesn't stop
monitoring, it just prevents the results from being admitted as
evidence. When did the FBI ever lose and invasion of privacy suit?
The FBI monitors many things now, without warrants. So do local police
agencies. Cellular telephone conversations and pager transmissions are
just two of them.

3. The bottom line, folks, is that you don't have legal rights just
because wome law says you do. The USA is a police state and becoming
more obtrusively so every moment.

As for YOU, Mr. Stark, you LAWYER, you should go take a course in
REALITY. Perhaps it'll wake you up.

: JG> As we all know, there is plenty of stuff going at 800 MHz besides
: JG> cellular.

: True.
: However, ICOM has no problem thinking that people will buy them, because
: people *are* buying them.

For a price, Grove Enterprises will modify practically any non 800-900 mhz ICOM unit by restoring the needed components for recieving this band, which also includes modifying the ICOM to receive cellular calls from 'domestic' -2 versions of the receivers. This is a great service to be encouraged of other vendors, as it's cheaper than importing the cellular capable species from outside the US. You can not order it that way from grove I don't think, you have to send it back and they restore the missing components to bring it back to full ICOM specifications instead of the shortchanged ones ICOM uses for common people in the domestic US.

Give Grove some business and long-live the cellular restoration of scanners!!

NO, it is not worth $450.00 because it is cellular blocked and overpriced.

You can by the same scanner from Javiaton in the U.K for $400.00 delivered
to your door, and the U.K model is NOT cellular blocked. You can find
Javiaton on the WWW. Btw, I am not in any way associated with Javiaton.

>

>When searching .. you can press limit and it will change from a resume
>search to a hold key.

The H/S / Priority sets and turns on and off priority for a particular channel; turns on and off the hyper scan mode

The S/S / Lockout locks out a channel in the scan mode and in the search mode it will
lock out a particular frequency during a limit or direct search S/S= Skip Search. You can program up to 50 skip frequencies in the scanner's memory. After 50 the next s/s will overwrite the 1st one. To remove a freq from skip memory, halt the search and select the frequency, then press S/S until L/O disappears from the display.

The RVW is for viewing those 50 skip freqs. To use, start a limit search, press SHIFT then press RVW. You can them go through the 50 skip freqs via the up and down arrow keys.

After pressing limit to pause the search, as you mentioned, you can single step via the up/down arrows. Press limit key again and resume scan search.

The belt clip is plastic, but seems to be pretty sturdy.

When I was in high school we had an interference problem on one of our local amateur repeaters which would key it up, sometimes for several seconds. Turns out that it was a Bearcat scanner several miles away with a loud local oscillator! Our repeater input was 10.7 MHz away below the city service departments frequency, and whenever the scanner stopped on the frequency it would bring up our repeater. We know because we tracked it down!

: Ahhhh, wait a minute. Are you saying that if I sit down with a bank
: of scanners, and some GOOD RF test equipment and a computer, and
: reverse engineer the proprietary protocol with no access to the
: original software or engineering documents (i.e. a "clean room"),
: that Moto can come after me? I doubt it.

Trust me. Reverse engineering is definately a no-no when it comes to Motorola! You can bet your bootie that they'd come after you. Unless you've just won the lotto and want to enhance your legal education thru practical experience I'd pass on the idea. But that's just me...

Protection of their protocol has less to do with *how* you got their proprietary information than it does with *what* you do with it after you have it! The protection is for the protocol *itself*. You're analogy is like saying that it'd be OK for you to market Coca-Cola under a different name using the original formula if you just sat back in some room with a bunch of flavors and figured out their formula. That's just not reality! Thou, some argue that it should be...

: Oh yes, they can
: make a heavy pass at me, but once thay find out that it was done
: in a clean room they have to back off, and I can go after them
: for false accusations (if I can financially survive the inital attack).

Well, it'd certainly be interesting for the rest of us to observe thru the commentary in the trade journals! You're biggest problem would be to "prove" that you didn't have any access to proprietary information or hardware during your project. You also hit the nail right on the head with your comment about "If [you] can financially survive...".

: I picture the hypothetical situation where I could have designed
: a board to plug into a scanner to monitor a trunked system, and
: did not own a trunked radio, or any moto s/w.

The problem is that unlike the *licensed* trunking algorithms and hardware, Motorola maintains ownership of their system. It's proprietary. Thus, it's protected and any reverse engineering with intent of duplication or distribution makes you a target for extreme legal attack!

Furthermore, the Gass case has less to do with use of equipment than with monitoring a data channel that, due to the intrepretation of one particular court, is deemed as *encrypted* data - not intended for public consumption. That makes it a prima facia violation of the ECPA. Successfully presented, I might add...

The point is further driven home by Motorola's fanatical pursuit to keep the software/hardware proprietary. However, *if* you succeed in building a board, I'd certainly like to purchase one. I *don't* think I'll bother sending in my "warranty registration card" thou! Wouldn't wanna be on any list of purchasers in your "office" when the documents were seized! :)

Motorola is trying to sell my employer on thier trunked system...they left 2 ht's for us to demo...ptt two-way and ptt phone. (mtx8000) These radios have programed into them all of the repeater systems in the upper snake river valley. I wanted to know these freqs...so off to my favorite radio shack store to borrow a rs freq counter. The counter would read the 3 watt signal at 15-20 ft. In the slow gate (highest res.) mode 818.5875 would display as 818.5883. I was able to get a total of 9 freqs on 3 different repeater sites (it's more than I had before). The counter never did display the correct freq...I don't know if this was the fault of the ht or the counter. Also there is a mod to put a hold switch on the counter. For the $80 sale price, it's a steal. If I had an extra $80 I'd have a counter.

Wow - good question.

It is a HOLD OVER from the old days when NYC was one of the first do go to a radio dispatch. Usually, in amateur and other CW (morse code) transmissions, you tell the other station that your morse transmission is over by ending with a letter - K

Otherwise, you might be pausing between words or otherwise sending slowly. The convention is to end with the K. KN if you only want the station you're communicating with to call you back, otherwise a third person might start sending to you.

I suspect that NYC has been using the K as a holdover from the original radio days when HAMS (undoubtedly) worked for the city's radio dept.

The normal end of conversation, in CW was K

I am sure they transferred this to voice.

Anyway, you'll hear it on police and fire.

"2950 to station. Show us available K"

Be seeing you,
Number 6

Hey All!

I'm looking for recommendations on a good mobile antenna to use with my BCT-7. Are the "converters" that let you use your regular AM-FM antenna with a scanner any good? I realize that nothing would compare to a dedicated scanner antenna, but I don't really want to drill holes or use a magnetic mount antenna. Since part of what I want to monitor is the CB band, I guess I should rule out glass mount antennas because I understand that they transmit very little signal at low frequencies. Any recommendations you can give me would be great.

Thanks in advance!

I'm not the one with the reality problem. Flaming people who challenge you to solve a problem rather than whine about it (and, BTW, I am not a lawyer) doesn't help at all.

You don't like what the government is doing? What are you going to DO about it? Point 3 above is just more anarchistic whining. Either participate in making the system work or keep quiet.

I just bought a Pro 2021 at a garage sale and it had no owner's manual. As far as I can see, the manual for my Pro 2028 is very close to being useable for the 2021. Can anyone tell me if there is anything different (besides the number of channels and the wider UHF range)? I was also wondering if there are any mods, the approx. age and the cost when new. I got it for 6 bucks and have had it going for maybe 8 hours now with no problems. Oh yeah - I had to put in a new 9v battery as it kept beeping and flashing a "BATT" indicator. I have had it working with 110 volts and 12 volts. Thanks for any info. I looked back for a month and 1/2 in this conference and found nothing I could use.

From what I understand they have portions of the 800MHz range there and
simply followed suit with a marketing blitz proclaiming them to be
"800 MHz" scanners.. however they do in fact have the designated blocks
in which cell is alloted BLOCKED. You can still recieve some images
on these scanners but in reality they are not able to tune the actual
real deal.

If you want cellular, the Radio Shack PRO-2006 is a better choice. Even
though the 9000XLT is an excellent scanner, the 2006 has better image
rejection. My first choice is the 2006, followed by the 9000XLT.

If you need frequency information for your area or area of interest, I'll do a search for you of my database and sen d you the results on a 3 or 5 inch floppy...you will get inn some cases over 30,000 frequencies! everything from the security guards to the Police, fire, and ambulances.

I need the following information:
1) city/state or area to search
2) latitude/longitude
3) postal mailing address...I can't attatch to e-mail

I'll send you the disk along with a sheet explaining how to extract the files .DBF file...I do charge a small fee ($10-15) depending on the search, this helps pay for the postage, disk, and keeping my data current!
JOHN
I have frequencies for the USA but also have a shortwave database...

Morse Code operators know that K means over. When the transisition to voice operations began many operators just used to say the letter K. While most voice ops choose NOT to use Q signals and other CW abbreviations on voice, in favor of plain language, a handful did survive the mode change, e.g. QTH, QSY and QRT. As a little kid, I can remember hams calling CQ and ending their transmissions with " K, someone please" routinely.

1773. Passive repeater antenna??

Newsgroup: rec.radio.scanner
Date: 1995-11-12 00:00:00 UTC
From: Dave Shaffer <DCS4@psuvm.psu.edu>
Message-ID: <95316.122621DCS4@psuvm.psu.edu>
Source record: 246543

I've seen cellular phone dealers promoting the use of a so-called "Passive repeater" antenna to use in vehicles with handheld cell phones. There are no wires that attach the phone to the antenna... it just mounts on the window and serves as a "connection" to the outside of the car.

Has anybody had any real experience with one of these either with a cell phone or with a scanner? Are they supposed to boost reception as well as transmission? (If so, they might increase reception on a scanner in the same frequency range...see what I'm thinking?)

On the surface, the concept sounds pretty iffy to me...and there is a cost incolved as well. Just curious if anyone has tried it!

> re detection of receiver use

In the book Spycatcher, it is said that British Intelligence used exactly this technique to discover the frequencies used by the KGB/GRU to communicate with their British Embassy Residence. By establishing a listening post near the embassy, they were able to hear the local oscillator of the receiver. They then looked for signals +/- 455 KHz or other popular IF's.

This book continues to be prohibited in the UK as a result of actions by the Thatcher administration.

have you thought of the fact that maybe the antenna isn't broken, but
rather the antenna CONNECTOR? this is a common problem with most
handhelds, having the antenna connector contact between the pc board and
the connector breaking. just open up the unit and tack solder it back
into being connected. 2 minute operation.

Yeah, but that was against a company that had considerably more money
than a scanner buff software company could come up with. What I'd like to
see is someone design a program for your computer (like Scancat) that you
could hook up and have control your scanner. Just release it on the
Internet to dozens of places like they did with PGP. It would be
impossible to control once it got to the net.

>-Remo
>
>

From what I understand they have portions of the 800MHz range there and simply followed suit with a marketing blitz proclaiming them to be "800 MHz" scanners.. however they do in fact have the designated blocks in which cell is alloted BLOCKED. You can still recieve some images on these scanners but in reality they are not able to tune the actual real deal.

a>I've heard many NYC Police transmissions both by dispatch and field
a>officers end or include the call "K". Does it have to do with the
a>Central Dispatch? I've even heard this on the TV show NYPD Blue when
a>the detectives call in. Real authenticity there! Anyway, any info?
a>Thanks,
a>Phil

I am sure that someone will correct me if I am wrong, but my
understanding is that this originates from the Morse code days, when the
letter "K" was sent to acknowledge receipt of traffic. Why it carried
over to voice, I don't know. In a similar vein, some PDs in Florida use
"QSL" to acknowledge receipt of messages.

WF> ...or else they changed their mind after Rodney King's assailants
WF>were heard transmitting racial epithets over the air....

Actually, all of that alleged stuff was transmitted in message form over the MDTs, not voice. And the LAPD released transcripts of it to the press. All traffic transmitted over MDTs is recorded in the computer that runs the system and can be reviewed at any time. Some systems routinely review that information.

It's a *lot* less expensive to get the attenuated patch cord (damn, looked
in the catalog, and can't find it. There's an attenuated adapter, though:
#274-300).
Waitaminit.. Here it is: #42-2152; $3.49US.

They are half original.
I guess since the jokes are based on truisms they are not that funny.

Burt Fisher (k1oik@ccsnet.com) wrote:
: Ham operator Jokes:

Hi Burt! I really miss your *perspective* on amateur radio over there on
the RIME network.

: 1. What is the thinnest book in the world?
: What hams know about women.

I heard "Italian War Heroes" myself.

: 2. How does a ham take a bubble bath?
: He eats beans for dinner.

Yeah, I heard "How does a redneck take a......"

: 3. What's a ham's idea of foreplay?
: A half hour of contesting.

I heard "Brace yourself Martha"

: 4. How can you tell if a ham is sexually excited?
: If he's still breathing.

This one is very old......

: 5. How many hams does it take to change a roll of toilet paper?
: We don't know...it has never happened.

The version I head was "Men" and not just hams.

: 6. What's a ham's idea of helping with the housework?
: Lifting his leg so you can vacuum.

Once again, I had heard "men"

: 7. What does a ham consider a seven course meal?
: A hot dog and a six pack of beer.

Once again, I had heard "men".

Burt, you're gonna have to do a little better than this!

Cheers!

Andy

Burt:

Did it ever occour to you that meeting someone in person is differnt
than meeting them on the air? In my 15 brief years as a ham and SWL I
have never heard a conversation, amateur or commercial that resembled
one I would have with someone face to face.

I dont remember ever telling anyone I was talking to face to face that
their voice was just above the noise level.

Furthermore I dont expect my radio contact to use perfect grammar or
say and do the things I do in order to enjoy communicating with him.

By the way Burt, whats this got to do with building and experimenting
this is rec.radio.amateur.homebrew isnt it?

BURT,
Annoying, slandering, mean-spirited are all easy attributes
and you excel in every field. You occasionally kinda sorta
show some intelligence. Why don't you quit taking the LAZY
route of cross-posting, and instead narrow it to the respective
group.
If seeing the responses generated by your remarks fascinates
you, I'm sure somewhere in the halls of M.U. is a psychology
professor that may be able to help you.
Of course, practicing what you preach would be nice too !!!

Geez, don't give him a clue! I've got a killfile that zaps all postings to more than 5 newsgroups, since anything that widely crossposted is always a waste of time. I had idly wondered why all the Burt followups had dropped off my radar, but was mainly just happy that they had. (I happened to trip over your posting while experimenting with a different newsreader configuration.) Burt, *please* keep on crossposting, it really helps me out.

(BTW, I also kill every post with a subject in ALL CAPITAL LETTERS. They're also uniformly worthless. Funny how these things work.)

Rich

You just go to show that "foamers & droolers", do have a place
in this world. Even an idiot like you can find your way into
Ham radio, an computers. Now if only you had something worth
while to say or do..?
If nothing else you are fun <?> to watch <???>. You at least
give us something to laugh at...

BTW> If life gets too much for you to handle, there is a site on
the www// that provides information on the: Do it yourself -
Frontal lobotomy <using 38 - 357 - 45 or what have you>,
Do it yourself Electro Shock therapy <just requires 2 pieces
of number 6 wire an access to a 220v electrical panel.> or
the ever favorite Birth-Control Retro=active classes.

Now you can see how boring it is reading useless crap...
Do yourself a favor, find a new or different hobby...
Unless your 10-13yrs old & like flaming & whinning...

1817. John Roberts (SK) Estate - Does any club want his notes & docs?

Newsgroup: rec.radio.scanner
Date: 1995-11-13 00:00:00 UTC
From: mc@shore.net
Message-ID: <487au2$ct8@northshore.shore.net>
Source record: 246494
Cross-posted to: rec.radio.scanner,alt.radio.scanner

A couple friends and I are helping the executors with the disposal of the effects of the late John Roberts, a well-known HF RTTY, VHF/UHF monitoring enthisiast. John's knowledge of radio and electronics has been described frequently as "encyclopedia".

We have a liquor box filled with his papers, loggings, notes etc that pertain to his radio listening interest. We would like these to go to a scanner club's library rather then throw them into the recycling bin.

If you are a member of the executive or a researcher and would want to discuss getting John's notes, please reply by e-mail.

1818. Re: problems with scanners and use of cell phones

Newsgroup: rec.radio.scanner
Date: 1995-11-13 00:00:00 UTC
From: Scott Van Aartsen <svanaart@nwciowa.edu>
Message-ID: <486hk4$h4h@news.iastate.edu>
Source record: 246495

By the way, I used to think that it was a case of my phone's transmitter blowing the front end off my scanner -- antennas too close, etc.

I don't think that's the case. I watched my phone change channels in the tech mode, and the birdies remain the same. I used to think there was a pattern to this, but that doesn't seem to be.
Also, if it was front-end overload, it would happen on most channels instead of a few, and with either my or my girlfriend's phone (both 3W), no?

My wife recenlty bought me a BC890XLT. As I was reading the manual, I noticed that there is an add-on board that I can put into my new scanner. After reading all the docs etc...I still dont understand what exaclty the CTCSS board does. Can someone explian to me what this board does, why would I want one, and should I get it? and to top it all off...Could you explain it in laymens terms?

Thanks..

Peter Wright, in his book "Spycatcher" (the one that was banned in England in 1987), relates how the British secret service used to lurk outside various embassies and tune in to various "spurious" frequencies of embassy radios in lieu of trying to find the actual transmission frequencies.

1825. Question about AOR3000A ??

Newsgroup: rec.radio.scanner
Date: 1995-11-13 00:00:00 UTC
From: root@rwx.berlin.snafu.de
Message-ID: <4880pr$fc@unlisys.unlisys.net>
Source record: 246502

Today I saw an ad from an electronic market here Berlin about an AOR3000A scanner, it was selling for around $ 650. It reaches from 0.01 - 2026 MHZ they said and has a RS-232 port.

Any qualitative comments on this ?
Is there any software outside (Amiga/MS-DOS/Win) available, perhaps shareware ?

Is this little thing worth its money ?

Thank you for answers...

bye

Source record: 246504

To my knowledge the software and "hardware board" has been designed and produced...at least in prototype form. There was a guy on Compuserve who has been discussing this for 2 years. Last I heard he was waiting on a small shipment of these boards that he was going to sell. He had a list a mile long of people who wanted one. Claimed it would do Motorola type I, II, and IIi systems.

If anybody has CIS access, please give us an update.

DOUG

Yes, that is what I am saying. It isn't necessary to generate a whole
bunch of Watts for a signal to transmit from point a to point b. For
some reason this particular scanner had a very loud local oscillator
and it was connected to an outside antenna (which I didn't mention in
my post). I'm not sure how to convince you, maybe you'll have to
track one down yourself sometime and then you too will know how far a
receiver *can* transmit.

B >realize that the optoelectronics 456 is a good unit but it will
B >not work on a PRO-2004. I was wondering if any users of the HB232
B >(Bill Cheek's interface) would mind sending me feedback
B >(positives, negatives, shortcomings etc.)

Here's some of the things it can do (geared toward the PRO-2004/5/6).

Extends virtually EVERY aspect of the scanner to the computer's monitor and keyboard. For example, a replica of the scanner's front panel is displayed on the monitor along with a keypad emulator to show the keys to be pressed as if you were operating the scanner in a normal manner. As the scanner operates, the computer monitor shows EVERYTHING that the scanner shows in its display! Not only can you operate the scanner from the computer's keyboard, you can also operate from the scanner as well. The CE-232 does not slow down the scanner nor alter its peformance in any manner!

* You can see & operate every function of the scanner from the Keyboard!
* The CE-232 can download anywhere from one to 400 channels in one session, either from you punching the keyboard, OR automatically from a previously prepared list of frequencies. Manual or Auto-Programming can include channel number, frequency, DELAY, MODE and LOCKOUT functions as desired.

* The scanner is fully programmable by the CE-232 in all modes, etc!
* The CE-232 will auto-log for an unlimited period of time, any and all activity that the scanner encounters, whether in SCAN or SEARCH modes. Each "event" (squelch break) is logged to a file as a line item similar to:

CHANNEL-FREQ-MODE-DELAY-LOCKOUT-FUNCTION-STEP-DATE-START TIMES & DURATION

Autologging can be turned on or off at will. Autolog files are automatically opened and named with a date/time logo.

Autolog files can be programmed back into the scanner's channel memory at will with no manipulation or changes; just the press of a couple of

keys! This means that you can do a SEARCH function all night or day while you're away and then come home and program in each new found frequency quite simply, hands-off, in a matter of minutes!

* An easy-to-use autologging feature is available for many purposes!
* You can....disconnect the antenna; set the ATT switch to the -10 dB position and do a SEARCH from 25 MHz - 1300 MHz with the autolog feature ON. About an hour or two later, you'll have a file that contains just the BIRDIES in your scanner! Now you rename this file to something like BIRDIE.LOG, and the next time you do a frequency search, you can specify another CE-232 function called "BIRDCHECK", which will prevent the scanner from ever locking up on a birdie (or any other frequency that you insert into the BIRDIE.LOG). So, not only can you EASILY make the scanner forever reject birdies, but also pagers, data channels and other obnoxious signals that you don't want to monitor!!!

* The CE-232 discriminates against birdies and other undesired signals!
* The CE-232 sports a LOOKUP function which shows a line of data every time the scanner STOPS on a busy frequency! Your previously prepared AutoProgrammer File will do nicely for this function, and therefore will display whatever is in your database for that frequency! Great for quick identifications of the signals received by your scanner!

I use my autoprogram file in the lookup function, when the radio stops on an active channel say 155,490 the following readout appears in the window with the active channel highlighted.

,1, 155.5950,,,, Dakota Co. Sheriff 1100-F1 Dispatch / 2 T/A
,, 154.1150,,,, Rosemount 3500 Police
,, 155.4900,,,, Dakota Co. Sheriff F-3
,, 154.7850,,,, Eagan Police 3300 dispatching Rosemount Pd/Fd

* The CE-232 offers four user-definable switches which can be used to control add-ons or other modifications that you may have added to your scanner! Uses for these User Switches are virtually unlimited, but might include turning on/off things like Automatic Tape Recorder Switches; extra memory banks; Data/Tone Squelch and any other mods or add-ons that you've developed or acquired. These User Switches are controlled by the computer!

--==<<< Continued from previous message >>>==--

* The CE-232 comes with a built-in, easy-to-use text editor for editing and reviewing your log and configuration files without ever leaving the program! Also available are two user-definable "tool" menu selections. This means that you can specify up to two utilities of your own to be used with the CE-232 program!

One of the most used functions in mine is scripting. You can select from a varity of avalable scripts or write your own.

A simple script I use regularly starts and stops a tape recorder whenever _specific_ channels are active. Record only selected channels while scanning the full 400, or whatever you select.

Monitor several repeater input channels and switch to the output channel when a mobile is near your location. (great for high traffic citywide channels)

These are a few of the abilities of the '232, you Will find others...

Good Signals... LCM

* POW 1.0 On Trial * It's not hard to meet expenses, they're everywhere.

Try November 1995 Popular Electronics Magazine. Cover story article is about
an 800-900 Mhz block converter (to 400-500Mhz). Also, a kit or finished item
is available form Ramsey Electronics (716) 924-4560.

Device is called the SCN-1. Kit is $49.95, case is $14.95, whole assembled
and tested unit is $89.95.

I don't have any connection with them. I just happened to have the mag handy.

Also, I thought I saw a recent Grove Electronics ad that had one of these
gizmos in it.

A friend of mine has one and says it makes a big difference with his cell phone. I believe it works mostly for transmit, but that makes sense since you're sending from this little handheld device putting out just a few watts of power. The signal you're receiving is coming from a large transmit tower that I assume is sending at more than a couple watts. I doubt this antenna would be of much help with a scanner.

Bill:

The Bearcat 200xlt in question is not at fault. I have a 200xlt and it is typical to get 5 straight hours of listening from one full charge. Trying to get a full 24 hours out of any radio with such a small battery pack is almost unheard of. I would venture to guess that your scanner is working fine. I have found that other scanners that have the capability of switching between NiCads and Alkyline batteries have longer time per set of Alkyline batteries.

Hope this helps you out.

Len Gibbs

From: Scott Van Aartsen <svanaart@nwciowa.edu>
Message-ID: <486e8t$gar@news.iastate.edu>
Source record: 246579

Folks,

I have a Radio Shack transportable cellular telephone (one of the ones made by Nokia). It's really handy. The only problem is, when I turn it on, it wreaks havoc with my scanner! (A BC590XLT). It causes birdies, or something, on certain channels. It's not always the same channels either. Sometimes it'll lock up on 155.910 and 154.160. Other times it will be 155.190 and 154.190. When I lock one of these pair out, later, the other pair will start locking up. Then I can go back and lock the other two in--with no problem. Sometimes nothing locks up, but that's rare. I've tried using another scanner--my BC200XLT, and it locks up on the same channels. However, it also locks up on other channels that I don't have in the 590--primarily UHF channels. I tried wrapping the outside of the phone tranceiver in foil, and had limited success. I also tried sheilding the phone cord with foil..again with limited success. My girlfriend has a Motorola cellular, and my scanner and HER phone get along great. My scanner and phone are quite close to each other--but with the layout of my vehicle they almost have to be that close.

Please email any suggestions or common problems . . .

Thanks much,
Scott Van Aartsen

I have just recently purchased the antenna pack and I'm a bit confused about which is the RD27 and which is the RD150 antenna.

The diagram is quire different to the actual antennas.

The RD27 is for 27-100Mhz, and the RD150 is for 140-180Mhz.

One antenna is 12" long and the other is 7" long.

I would assume that the RD27 would be the 12" long one, but the description with the RD27 has (7") after it. The RD150 has no measurement specified.

Is the RD27 really the 7" one?

Hope someone can help.

Many thanks,

George

The railroad companies have been using "passive repeaters" for years. They place an antenna in the tunnel and connect it via coax to an antenna outside the tunnel. It has worked well for them. However, 800mhz is a much higher band. If you were in a steel van that had no windows, there might be a noticable improvement. But in a car that has lots of windows, you would need test equiptment to tell the difference. Buy a magnetic mount or glass mount and just run the coax to your seat. Connect the phone when you are in the car. Otherwise save your money.

Source record: 246436

Well, I might as well add my 2 cents worth. I have the RS Discone mounted on my chimney, up about 30 feet above ground level. I haven't tried a lot of different antennas, but the discone works quite well with my Pro-2035. I haven't noticed any low-end receive problems, but perhaps I just don't know what I'm missing! It does a good job receiving all the way down to CB frequencies, and an excellent job on the air band. It was straightforward to assemble, and it held up to 60 mph winds from last weekend's storm here in the DC area. In my opinion, the antenna is overpriced ($60 for a few chrome and brass parts!), but it works well for me. It's also light and fairly compact, which was nice when I was climbing my very steep roof to put the thing up!

I have not tried it as a transmitting antenna.

Whatever you do, if your coax run is more than 20 feet or so, use RG-8 cable instead of RG-58. Otherwise, the attenuation at the higher frequencies will become significant.

Cheers!
Andrew Clegg

Hi..

Looking for the freq layout of the cellular channels between 869 and
894 mhz.

In my area i'm picking up about 100 voice channels from 869.280 to
893.640 on both system A and B.

Is there a little program out there that will sort these freq's out.

Example...Input a freq and output--the reverse voice freq
--the cell ch number
--the cell site number

Any info(or program) would be greatly appreciated

Thanks in advance...

Ron

Where can I find a frequency converter that takes incoming signals (around 800-900 Mhz)and outputs the signals to around 400-500 Mhz. I'm guessing that because of the new cellular listening laws they aren't made anymore. Can I find such a device in kit form or new? I have a few scanners and all only cover up to 512 Mhz, but I need 800Mhz coverage to monitor police comms. Any and all help is appreciated.

Greetings:

I am the proud owner of one of these radios. I am VERY pleased with the performance of the RADIO section. However the software leaves a little to be desired.
The AOR3000a has 400 memory channels. These channels are broken up into banks of 100. There is no way to link these banks from the internal software, so you can only scan 100 channels at a time. There are a lot of other annoying idiosyncrocies with the software.
HOWEVER, The radio section (and the presence of a serial port) more than offset the software shortcomings. The radio seems to have very good sensitivity and selectivity across the entire tuning range. The number of birdies encountered has been small, and all of them can be squelched out.
The best use of this radio is to combine it with a PC and software to bypass the internal programming. I use a program called RADIOCTL. There is a DOS and an OS/2 version of this program, and it is Shareware.
If you plan to run your scanner from a computer, this is probably the best radio on the market for this function. Hope this information was helpful.

Rich

1874. Re: computers and scanners

Newsgroup: rec.radio.scanner

>computer? Any info is appreciated. Thanks
>
Greetings:

There are several way to connect a computer to a radio. Depending on the
connection made, there are different operations that can be done.

The first connection is from the scanner (or radio) audio output to a decoder.
The decoder is usually connected to the serial (RS232) port of your computer.
These decoders (sometimes also called TNCs) allow the computer to decode
weather maps, ham packet communications, morse code, RTTY and other forms
of digital transmissions. There is also software available that allows a computer
sound card to perform these operations instead of using a separate decoder.

There are several scanners on the market today that have RS232 (serial) ports
built in to the unit. ICOM, KENWOOD, and AOR all make units with this interface. In
addition, OPTOELECTRONICS makes add on boards for certain Radio Shack scanners,
that add this interface. The scanner serial port is used for controlling the
scanner from the computer. With this control, the functionality of the scanner
is greatly enhanced. More memory channels and automatic data logging are
just some of the possiblities. There are several programs on the commercial and
shareware market that interface to some or all of the radios mentioned.

And lastly, there is the human interface. The computer can be used for keeping
track of frequencies through database and logging programs. Use of some sort
of frequency database is a MUST for any serious scanner enthusiast.

Hopefully, this information is of some use. Happy scanning.

Rich

> city-wide fire, EMS, police emergency, and Port Authority emergency. And
> any others you think I might want.

For NYC*EMS try the following:

477.862 Bronx South
478.212 Bronx North
478.262 Brooklyn Central
477.912 Queens
477.862 Brooklyn North
478.012 CityWide (MCIs, Special Ops)

Also using a trunked system 854-860.987, 860.737, 855.487
(Trunking system is where Manhattan dispatch is as well as Brooklyn South/ Staten Island, and a host of other things)

For NYPD, the best freq is SOD Main on 470.8375. Manhattan precincts can be heard on 476.562 / 476.337 / 476.587 / 476.312 / 476.362 / 476.637

The cellular carriers themselves use passive repeaters in very
unique situations. They are sometimes used to provide some
coverage in areas that might be slightly shadowed from a cell site.
They are usually set up with a pair of a pair of good directional
antennas connected back to back with a "tuned" cable harness. But
they don't provide the type of coverage that a real repeater or
cell extender would.

A passive repeater that uses omnidirectional antennas, such as
those sold for cars, is not going to provide much, if any,
increased signal strength. You can't effectively repeat a signal that

weak without some significant gain in the antennas. Don't waste your money on a passive repeater for your car to help your scanner or your cell phone.

One Icom R-1 Scanning Radio
(100kHz to 1300mHz - *Continuous* Coverage)
Includes:

3 BP-84 (1000mHa batteries)
1 BC-72A (Drop-In Quick Charger)
1 CP-12 (12 volt auto cigarette lighter adapter/charger)
1 LC-61 (Carrying Case)

The R-1 is excellent for covering 800 mHz+ with it's selectable channel steps, multi-mode operation and sensitivity. This radio system only has a few hours on it. All items are in original packaging and boxes and include all accessories and instructions. Please contact direct e-mail with questions or serious offers. Asking $500.00 (Cashiers Check/Money Order) and will pay UPS insured shipping (CONUS Only) at this price.

I think Garry is right, the new 900 MHz cordless phones operate in the 902 - 928 MHz range. This is also the only band where the FCC allows "unlicensed" spread spectrum communication (including cordless phones from Uniden, Escort, St. Tropez etc.)

It is a pretty good scanner. $650 is a very good price.
Computer control of this unit is not that great. It is slow to
lock onto frequencies so scanning is slower than without
the computer. I tried it on mine for a while and gave up.
The 3000A is not a very good "first" scanner, but if you
already have a few, it is a great addition.

I recently bought a Yupi 7000 (second hand) and have noticed an annoying fault where occasionally the sound cuts out when any of the top controls are used, the antenna is 'wiggled', or an earphone is plugged in.

My guess is that it has taken a knock to the antenna and this has cracked something internally, hopefully not the main PCB.

Has anyone else attempted to repair one of these? Any hints? eg should I lift the back away from the front, or the front away from the back? are there the ubiquitous small springs inside that will automatically ping into dark corners & never be see again? ;-)

Thanks,
Matt

You are probably getting cellular. I have a PRO51 and receive the cel. freqs. I know the scanner included cellular freqs. at one time and RS had to make a mod to eliminate them. It is easy to figure out if you're receiving cellular or not. For one thing, people are constantly telling the person their talking to 'I'm in my car' or I'm on my cellular phone', etc. Also, you can hear a tone before the call is switched to a different cell, and then you loose contact with that call. Let me know. Regards, Leroy Butler

Grove advertises the GRE Super Converter (they call it model CVR 3) for US$84.95 in their latest catalogue. Their order line is 800-438-8155. They're also on the net at www.grove.net.

1889. DTMF Decoders

Newsgroup: rec.radio.scanner
Date: 1995-11-14 00:00:00 UTC
From: hazen@lava.net
Message-ID: <48b2em$k53@malasada.lava.net>
Source record: 246457

Has anyone had any experience using decoders Cool150 or
DTMF_rt2 ? Cool150 looks like an awesome program but all I could get
it to do was analyze the frequency of the tones and that doesn't do
any good being as how some numbers have the same freq down to a
tenth of a decimal point (or at least that what seems to be the case).

And as far as DTMF_rt2 , I don't know what the hell is wrong
with that thing.

1890. Radio Shacks Freq counter

Newsgroup: rec.radio.scanner
Date: 1995-11-14 00:00:00 UTC
From: cchst14+@pitt.edu
Message-ID: <48b8cs$g1u@usenet.srv.cis.pitt.edu>
Source record: 246458

Hey, I just recently purchased radio shacks freq counter... $79.00 is an attractive price - the question is, does it do what I need it to?

Here is my situation. I see a security guard across the street, maybe down a block. Can I pull up my RS counter and get his frequency? Im assuming I can get his receive by a standard shift(+ or -) ...

Next situation. I'm in a hotel, see a lady talking down the hall on a walkie talkie- Can I pull this out and get the frequency?

I've been messing with fastfood low power repeaters, and RS's counter does NOT lock on any freq..... I was standing RIGHT next to the transmitter Im sure this would be a strong signal....

Is this counter gonna work in these situations, or do I need something better?

Thanks

>receiver *can* transmit.

When I lived in New Hampshire back around 1981, we had a repeater on (I think... that's a long time ago) 145.23 MHz. Driving around the countryside, a very annoying popping noise would open the squelch on our mobile rigs. Turned out that one of the local cop frequencies was 145.23 + scanner IF and the LO popped out right on our output frequency. I don't know if these scanners could be heard for miles, but they certainly could do several hundred yards to a 1/4 wave mobile antenna.

Hi,,,

Does anyone out there have a breakdown on how the LAPD's
divisions are organized as far as which divisions cover
the various geographic areas in LA?

What I'd also like to know is which division numbers correspond
to those areas, e.g. patrol car designations 6-Adam-39. What division
would 6 correspond to?

And last but not least.... From what I understand "Adam" corresponds
to a two man patrol unit, "L" corresponds to a one man unit and "Mary"
corresponds to a motorcycle unit. I believe "X-ray" is either a detective?
or one of the specialized units. What other code names are used?

Please respond via email as I only get to read these newsgroups periodically
as work permits...

Thanks...

Please get your 'facts' straight before posting. It sells for $400 to
$425. It has 400 channels. It is not tuned to 'the licensed radio
range', mostly because there is no such thing. What is the licensed
radio range that you refer to?

Yes it is a frequency counter. I personally do not have one but I know someone who does and they are happy with it (especially since it can control their AR8000). For specs, price and a catalog with lots of cool toys try Grove at 1-800-438-8155.

I'm looking for the frequencies that campus safety uses at my school,
Lewis & Clark College.
AFAIK, they have CBs and some sort of radio phone thing. You can call
their on-campus number, and you usually get the dispatcher, but if the
dispatcher's not there, it goes directly to this crappy connection to the
officer, wherever he or she may be.

Any ideas where the freqs might be?

> need to remove all eight.

[SNIP SNIP SNIP]

OOOOPPPSSSS.......NO NO NO......don't do what I just suggested. Must
learn to read more carefully.......

The details I mentioned were for the MVT-7100 not MVT-7000 !!!!
^^^^^^^^
Apologies for wasted Bandwith.

So, lets try again....engage brain: mirror, signal, manouvre.....

MVT-7000 not quite so easy.

Remove batteries. Remove two screws from bottom of radio. Carefully
slide out the two small metal lugs in the battery compartment that these
two screws go into. Don't want to loose them.

You will probably find removing all eight screws down the side a better
option first time around, so take all 8 scerws out.

IMPORTANT

Remove the rotary dial knob and the locking nut.

You will also need to carefully remove the strip down the left hand side
which is stuck down.

The radio will split into two however be very careful at the top near
the rotary dial. You need to carefully guide the rotary dial down
through the hole in the top plastic section. The top plastic section
will stay rigid as it is retained onto the back half. The rotary dial is
actually connected to the board on the front half of the radio so go
gently with it until you can "see" whats happening. It can be a little

"tricky" so just go carefully.

Only connecting cable is the speaker cable which goes to a jumper block.
Its long enough not to cause any problems.

Once apart just keep an eye on the black lamp button and key lock slide
switch. Also the four screw splates will be loose if you took all eight
screws out from the side.

The bottom RF board will lift out if you remove the three screws holding
it down.

I recently acquired the ce-232(the new hb232)from Bill Cheek.I use it on my pro2006,43,39,&34.On the 2006/2004 scanners it is a killer system.Also it is on sale now for $149.Features:1)Autoprogramming-It will automatically load freqs into your scanner from a file.All you need to do is make the files press a couple buttons and sit back.2)Autolog-when on it logs all hits with a time stamp and duration to a file you can look up and print or whatever.3)Look-up-It will look up freqs ,your radio lands on ,in a file you designate.I.E.If the radio lands on 154.8450 and the lookup feature is on the lower screen shows the freq and any info about it which is in your file.There are alot of features i havent even realized yet.It is an excellent system especially for the money.Also you can operate the scanner from your computer keyboard.And a facsimile of the scanner display and keyboard is on the comp screen.Bill also backs it 100% with technical help through e-mail and his BBS.If you have any more questions e-mail me Pro43@AOL.com Ira Cooper.

I tend to disagree with this advice. Nicad's longevity depend on going through full cycles. If they are charged frequently without fully discharging, they develop a "memory" which reduces capacity. Nicads can also develop a reverse charge when fully discharged, and even develop shorts. My advice would be to fully charge the batteries for storage, and trickle charge once midway through the off season.

Where can I find a FAQ on the Icom R1? I'd like to know the
shortcomings and advantages of this receiver. Thanks.

What a FINE scanner this has been!

I hear there's no way to do mods on it - true or false?

I must congratulate Realistic - this scanner has been going
strong for a long time now - and I've had lots of fun on it!

Anyone else using this particular job?

/.>
/.>..Peter
Sorry, but this won't be effective. First, the transmitter on the base
side will never change signature regardless of where the input comes
from. Therefore, the only way this has any chance of working is to
listen to the mobile side of the conversations and that would mean a
relatively high, centrally located antenna(s). In addition you would
need some significant processing power to collect enough information and
classify it fast enough to switch channels. All this would cost a lot
lot more and work much less efficiently than some of the more direct
methods of following these systems...perhaps even less effective than
simple brute force of programming the radio over and over until you hit
it...for the money you would spend above you could buy and program enough
radios in about two weeks to hit it and, if you bought portables, you
would end up with a working scanner.

From: essay@aztec.asu.edu
Message-ID: <48dfrt$224@news.asu.edu>
Source record: 246400

Have use my 2006 in my car when I was a 9-1-1 operator. Could find out what was going on a work on the drive there.

I used the car antenna thru a RS all metal Y-adaptor and it worked quite well. When I tried to use a coax Y I made myself, I got a lot of noise on the AM/FM when the 2006 was plugged in.

Now have the 2006 on a shelf at home and am using the metal shelf brackets as the antenna. Also have my Yaesu FRG-7000 clipped to the same shelf for its MF antenna. When the 2006 is turned on, I get a lot of IF type noise on the FRG-7000.

Any suggestions on a cure for the 2006 or is there something going on inside it that needs to be corrected.

E-mail or post the replies.

TIA

Which transmitters would you monitor for signatures?
The mobiles? The bases?

It wouldn't make sense to monitor the base repeater outputs.

The mobiles are difficult to hear due to their locations,
low power, and low gain antenna (hence the need for a repeater).

Instead, are you suggesting monitoring the audio and comparing
some form of audio signatures?

Source record: 246402
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I would like to hear from people who have used any of the
JPS Communications noise reduction devices with scanners. I live
in New York City, where I use a scanner to receive transmissions
in the 40 to 50 Mhz range. I have a dipole antenna on the roof
of the four_storey brownstone in where I live. In addition, I
have a bandpass filter designed to block out all frequencies
except for those falling in the 40 to 50 Mhz range.

Because of where I live, I experience a great deal of
noise in my reception. I am thinking of purchasing a noise
reduction device from JPS Communications. (They have a home page
on the World Wide Web.) If anyone has had any experience with
using such devices with scanners, I would appreciate a post to
the usegroup alt.radio.scanner or rec.radio.scanner or e_mail to
me directly. I would like to know what device you used and how
effective it was.

I am Richard, 75353.225@compuserv.com. Thanks.

While this story does sound kind of far off, I can believe it could happen. Any electronic device puts out some form of RF that can be detected with the right (or in this case the not correct) equipment. After all, there are units out there being used by law enforcement that can detect the RF signal from an active radar detector (not a jammer, but run of the mill detector). The RF output is also one of the reasons given as to why we can't play radios, TVs, and certain other electronic devices on a commercial airliner.

Hello,

I am also using the scanner. I agree with the following:

- computer interface is slow. I mostly miss that it is not possible to
start the scanner (which is very fast) and then read back a used freq.

- on hf its useable, but large signals may interfere with lower. I mostly
have to use the attenuator then. I have a modification inside which
enables me to switch on a narrow AM filter, and thats really useful.

I verfied the sensitifity:

* on 70cm (432 MHz) I compared it to my IC475 when doing EME
(Earth-Moon-Earth) reception. It was a little bit worse, but
signals copied with the ham radio transceiver were also readable.

* on 23cm (1296MHz) I compared it to my Standard C-568 triband handy.
RX sensitifity is equal or better, but the audio is really better
as it has a larger loudspeaker.

much fun with the radio!

Hi Richard:

As far as I know of, the NWS only uses the VHF weather broadcast
frequencies for all services. Alerts, watches, and warnings, are
usually proceeded by a 1050? Hz tone that will set off monitoring
receivers you can buy from the 'shack.

You might be thinking of the Skywarn nets, run by the amateurs.
If you ask around, someone probably has that info.

David Crawford / dcrmatt@vnet.net

> Looking for the freq layout of the cellular channels ...

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System

800-832 869.040 - 870.000 RCC - voice
1-312 870.030 - 879.360 RCC - voice
313-333 879.390 - 879.990 RCC - data
334-354 880.020 - 880.620 Telco - data
355-666 880.650 - 889.980 Telco - voice
667-716 890.010 - 891.480 RCC - voice
717-799 891.510 - 893.970 Telco - voice

Mobiles transmit 45 MHz below the base (824.040-848.970) and
are usually repeated by the base. Channels are 30 kHz apart.
Channels 800-832 are also identified as Chs 991-1023.

Hi Ron,
I love the idea of a web site for us Canadian users. I checked it out once before and found only freq for
Ontario region. Do you have listings for province by province. Do you want any for the lower mainland
here in B.C.?

Just wondering?

: >AOR8000)

I reccommend the 2006, AOR 3000a, Icom R-100, or Icom R7000. Any if these will work great, 've used them all. Celular isn't that important as it gets old after awhile..

2006 is my first choice.

Hi.. I am new to this news group, and I was wondering, what is pd-102?? is it a program to decode pager pocscag? I want to do this.. and have no idea where to turn for info. I was under the assumption that, by now, someone would have written software, and designed a simple interface, to do this? Is there such a thing? and if so, where can I get ahold of the softwre? Thanks for your time..

No, it was Uniden, for years they have sat on most of the good patents
that came out of Regency and Electra.

This is part of a device you could build to listen to trunked communications without knowing the trunking algorithm.

I've done _considerable_ experimentation with the "public domain" POCSAC
decoder, as well as written my own version. From my experience, I would
suggest that the single most important factor in sucessfully decoding POCSAG is
to modify the receiver to bring out a good clean signal dirrectly from the FM
discriminator, _before_ any de-emphisis. Most any op-amp or comparator will do
nicely to square-up the resulting signal.

>

No, I don't own a scanner. And I do not need any knowledge (besides real basic)
of how trunked works. I certainly do not need any proprietary information.

The technique is simple (for engineers and the gov't).

Say a trunked system has 16 possible carrier frequencies, and maybe a few hundred
or thousand radios. Whatever. You need 16 receivers and the DSP based signature
analyzer with 16 inputs. Then you need a 16 x 16 audio matrix switch.

When a transmission occurs, the transmitter will have a characteristic "signature."
Now, the DSP seeks out this signature and "follows" it, controlling the matrix switch
to feed audio to output number 1. The max number of concurrent conversations is
16.

It is helpful to buffer, digitally, the audio (via the DSPs, of course) so you can assure
uninterrupted audio during the time period it takes the sig analysis to locate the
proper channel.

..Peter

1950. Icom IC-R1 (Totally Unblocked) For Sale

Newsgroup: rec.radio.scanner
Date: 1995-11-15 00:00:00 UTC
From: bjones@aramco.com
Message-ID: <NEWTNews.816479961.7777.bjones@bjones.aramco.com>

tx.forsale,rec.radio.swap,rec.radio.shortwave,rec.radio.scanner,houston.forsale,dfw.forsale,alt.radio.scanner,alt.forsale

One Icom IC-R1 Wideband Receiver
(100kHz to 1300mHz - *Continuous* Coverage)
Includes:
3 BP-84 (1000mHa batteries)
1 BC-72A (Drop-In Quick Charger)
1 CP-12 (12 volt auto cigarette lighter adapter/charger)
1 LC-61 (Carrying Case)

In a world filled with signals and sounds you need a communications system you can rely on. Now you can hear communications around the globe with a tiny package that fits snugly in your pocket with Icom's IC-R1, one of the smallest communications receivers ever produced. This IC-R1 is excellent for covering 800 mHz+ with it's selectable channel steps, multi-mode operation and sensitivity and continuous coverage. This system is new in the box and all items are in original packaging and include all accessories and instructions. This radio has 100 memory channels, AM, Narrow-Band FM and Wide-Band FM modes, advanced scan functions, a 24-hour clock & timer, etc... Please contact direct e-mail with any questions or serious offers. Asking $600.00 (Or Best Offer) and will pay UPS insured shipping (CONUS Only) at this price. This is a VERY good price for this package, if anyone wishes to verify this call Grove Enterprises at (800) 438-8155 and inquire about pricing on the above equipment (or call any Icom dealer).

FYI - I love this radio but have five scanners/receivers already and want to find a good home for this radio so I can buy a dual-band (144mHz/440mHz) handheld amateur transceiver...

Best Regards,
Billy R. Jones - KC5EVD

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 and PRO-60 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend

reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu (until Oct. 10, 1995)
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions will contain selected business listings, too.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees,

listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about

$100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. New RadioMap reports | include a frequency allocation histogram, a 0 - 1,000 MHz | "spectrum analyzer-like" display showing spectrum usage in | the map coverage area.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency

assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. | Club dues are $27.00 per year, which includes the monthly | Scanner Journal, approximately 50 pages in 8-1/2" x 11" | format. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. The RCMA | web page is at http://comp.uark.edu/~plaws/rcma/.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC, Aurora Ave.
August 19
October 14
December 9 - Philly's Restaurant, Rt 83 & 63rd St., Willowbrook

Bring a notebook.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies. The 1996 edition will contain selected
business frequencies, too.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from

Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown. In 1996, Beyond Police Call may be replaced by expanded regional copies of Police Call.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring

Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, and organizations across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom

RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. New RadioMap reports | include a frequency allocation histogram, a 0 - 1,000 MHz | "spectrum analyzer-like" display showing spectrum usage in | the map coverage area.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 50 | pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A

recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's

transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 110 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these recent scanner models in Monitoring Times magazine:

Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurments |
Dec 1995 - Radio Shack PRO-2040 |

Note: Reprints of Monitoring Times articles are available for $2.00 each from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin

19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end

circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good

scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line,

overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack

crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane

keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or

scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage. Cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd

for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning.

PRO-26: Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. Audio suffers from small speaker.

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic

Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021.

> the ubiquitous small springs inside that will automatically ping into dark
> corners & never be see again? ;-)

There are 8 screws down the side, remove the four from the front, no
need to remove all eight.

Take the batteries out !

The radio will "split" into two - no connecting wires or anything.

Front half has CPU board. Back hald RF baords. You will need to remove
locking nuts on all three rotary dials on the top before attempting to
remove the top board on the back half. Two screws at the bottom secure
this internally. Remove these (and the locking nuts) and that board will
lift out. The bottom board with the antenna connection can be lifted out
after removing the screws holding this down. The Top plastic will come
out with this board as is attached to the BNC connector.

Hope this helps.

Berny In answer to your question.

The 225.00 thru 399.99 is used by the military and federal Government
law enforcement agencies, i.e. DOD Fleet Satellite Communications
(FLTSATCOM), Air Force Satellite Communications (SATCOM) and general
military aviation communication.

Can anyone provide some basic info about the Tulsa system the Gass hacked?
Was it a SmartNet-I, or SmartNet-II?
Was the police department fleet a type I, II, or IIi fleet?
Further, if Gass used Standard brand radios how did he get them to emulate any other Motorola format other that type-I?
Many of us in this group would find this info interesting.

1958. Any Pro-62 Mods??

> Is this counter gonna work in these situations, or do I need something better?

The counter is intended to be *attached* to the circuit being measured. If
you put an antenna on the input, you can pick up signels from a tranmitter
a few *inches* away, maybe a few feet if it's a powerful transmitter.
There is a device that will do what you want; it's called the Opto-Scout.
It has greater sensitivity, and therefore range, and is intended for just
the sort of signal-sniffing you're thinking of. I think it sells for
around $300.

Disclaimer: no connection with Opto-anything.

>>discover how to move at light speed, or even anything approaching
>>efficiency. Is LAPD switching to 800? It appears so. WHEN will LAPD
>>make the cutover? Years from now...

A few months ago the local L.A. news channels had varying stories
about the "LAPD going to a new digital system that can't be scanned by
high tech criminals, and that several officers will be able to talk at
the same time unlike the current system where everybody has to
stand by while one officer broadcasts from the field". They also
reported that one (unknown) division is already on this new system and
the others will follow within the next several months" so maybe
it will be a trunked system(?) Not direct quotes but this is what
i gleaned from the various versions of the different stations reports.

However, i'm not aware of any divisions that are no longer on the
old 506-507 frequencies, they all still to be active. I'm worried
that i soon wont be able to scan at work in South Central (77th)
i'd hate to not know just why that air unit is over our shop !!!

Randy

Joshua Berezin (josh@sun.lclark.edu) wrote:
: I'm looking for the frequencies that campus safety uses at my school,
: Lewis & Clark College.
: AFAIK, they have CBs and some sort of radio phone thing. You can call
: their on-campus number, and you usually get the dispatcher, but if the
: dispatcher's not there, it goes directly to this crappy connection to the
: officer, wherever he or she may be.

: Any ideas where the freqs might be?

: josh

State universities in Illinois use 453.900 for police and 453.875. These
are Public Safety frequencies. Your school may use the business band if it's
privately financed. I doubt that they're using CB.

The following is the begining of a mini-faq on Motorola VHF/UHF/800mhz radio systems. Motorola radios are widely used accross the US by the Goverment, Public Safety services and Businss users due to their high quality. All specific model and systems names mentioned below are registered trademarks of Motorola, Inc and the following descriptions are intended for information purposes only.

If anyone can provide addition information on Moto radio systems or specific model capabilites please post.

GP-300 UHF 08 mode 08 channel HT
GP-300 UHF 16 mode 16 channel HT
GM-300 UHF 16 channel

HT-600 VHF/UHF 02/06 channel/may include DTMF
front-panel

P-110 UHF 06 channel
P-200 UHF 06 channel

(Jedi System)
HT-1000 UHF 16 channel / may iclude scan function
MT-2000 UHF 48 channel / top display
MTS-2000 VHF 136-178mHz
MTS-2000 UHF
MTS-2000 800
MX-300R UHF 12 channels/black rubber finish (US Govt)
MX-300S UHF 12 channels
MTX-800 800 Trunked - Single System
MTX-810 800 Trunked - Multiple Sytem
MTX-900 900 06 channels/DTMF

(Saber System)
Saber I

Saber II

Saber III VHF ~136-174 mHz 72 channels May include DES-XL
UHF 72 channels May include DES-XL
(Saber III systems include 6 zones (12 channels each zone), 72 total channels

Syntor X-9000 32 channels
Syntor XX Mobil VHF 32 channels 100 watts / may include scan

(Astro System)

Expo ??? May include DES

Radius VHF
Radius UHF 02 channels
Radius VHF-Low 16 channels (Can mod to 6 meters)

Mitrek VHF-Low 01 channel (40-50 mHz) (Mobil)
Mitrek UHF 04 channels (25-40 wattts)

Unknown
300S VHF ???

1973. Light on BC100/200XLT ???

Newsgroup: rec.radio.scanner
Date: 1995-11-16 00:00:00 UTC
From: Dave Shaffer <DCS4@psuvm.psu.edu>
Message-ID: <95320.115354DCS4@psuvm.psu.edu>
Source record: 246350

I have a Bearcat 200XLT and previously owned a 100XLT.

Both models have a [LIGHT] button, but the light only stays on for a few seconds. It would be nice if there would be an option to override the timer...so the light would stay on longer...say if you were powered from the charger of a vehicle...and battery life was not an issue.

Does anyone know of any way to do that? Perhaps an undocumented feature? (I'm wishing for a lot, here, I know, but it *would* be nice, wouldn't it?).

- Dave

1974. Bearcat BC-8500XLT scanner *FOR SALE*

Cross-posted to: rec.radio.scanner,triangle.radio

From what a Motorola Tech over here in Durham said, this is the most loaded-with options MT-500 HandiTalkie he had every seen.

8 channel (apparently has a ham channel already installed), with scanning built-in, DTMF keypad, private line, 4 watts...charger comes with it (Motorola's RapidCharger ~1.5 hours).

I know for a fact that this mil-spec radio went for ~$5,000 when new, and this set is in like-new shape...the charger looks like it's had some use though.

Looking for ~$400.00/offer, including shipping if necessary in the US.

Email if interested.

Message-ID: <48geau$55l@milo.freenet.vancouver.bc.ca>
Source record: 246353

Saw this interesting device at a local store. It is a flip-phone type cordless and small and has all the goodies for a typical cordless but no display. The only intresting thing about this device is that it has scrambling added to its two-way handset <-> base.

Is this thing that secure as it claims? I actually tried the demo on this unit, and heard sound like donald duck. Must be simple speech inversion trick only and can be decoded easily?

Any good cordless out there (49Mhz/900Mhz) with better security measurement like digital encryption or something?

Greets...

Assuming you have not received a dozen replies, here goes:

A scout is a freq counter and more. It logs "hits" of RF, i.e. a signal coherent enough to look like a transmitter was keyed. It logs the freq and the number of times it occurred. I have the original version which can be bought for much less than the current model. [I found it used on this conference.] You can carry it in your pocket and IF YOU ARE NEAR ENOUGH TO SOMEONE WITH A TRANSMITTER, it will record the frequency. It has a vibrate mode to indicate that it logged a freq, or you can have it beep.

It is a neat toy but way overkill for most people. Buy it used as most owners get very little use out of it and it tends to gather dust. But if the freq you want is not known, the scout is the best way to get it.

For Sale AOR AR8000 receiver:

Full coverage - 100kHz to 1900MHz continuous no gaps, full 800MHz
coverage
All Mode Reception - AM, USB, LSB, CW, NFM, WFM
Programmable Step Size in 50Hz increments
4.0kHz SSB filter
Alphanumeric multi-line display
Signal Strength bar graph
1000 channel memory bank
computer control I/O port.

Too many features to list. Basically, top of the line receiver with
full coverage.
Purchased in Europe while on vacation, barely used. Price includes
complete unit with
manual. Asking $550.00, I'll pick up the UPS shipping (within the
U.S.).

SO>scanner, it was selling for around $ 650. It reaches from 0.01 - 2026 MHZ
SO>they said and has a RS-232 port.

SO>Any qualitative comments on this ?
SO>Is there any software outside (Amiga/MS-DOS/Win) available, perhaps
SO>shareware ?

SO>Is this little thing worth its money ?

It is a good lo-band on up scanner, but an average HF radio. At
$650, buy it before I do. It goes for a grand new. The only
drawback is that it is not portable. It is best used with
a computer to drive it. It is very sensitive and at the same time
does not have intermod problems.

The software is available (scanstar, scancat, etc) and reasonably
priced.

If you don't want it, please tell me how to get it.

>Thanks..
>
>
The CTCSS board is board that decodes the subaudible tones on the radio signals. What it does is if 2 agencies are on the same frequency, you can set the CTCSS to decode one of them IF YOU KNOW THE CORRECT TONE. You have to know the correct tone for it to work, but the CTCSS is used to FILTER unwanted signals. If you have interferece on a frequency, you can filter it out because your radio will NOT allow the interference through because it does not have the tone on the signal. That's the meat of it. You CAN monitor a signal with a tone on it, but as i said CTCSS is used to filter out unwanted signals. That is all. In ham radio, CTCSS is used to keep "intermod" or interference from bringing up a "repeater". The CTCSS baord DECODES signals with subaudible tones.

Hello All!

Clueless scanner newbie is looking at possibly buying RS Pro-51 for my first scanning toy. The local Radio Shack has them on sale now for $199.99. Regularly they are apparently $300 + Any advice, thoughts or comments on this or any other handhelds in the $300.00 range is greatly appreciated in advance. Thanx!

.....(snip).....
Intel is/was involved in allowing other companies (AMD) to make the 386 or 486
or both,technology sharing agreements,all sorts of complex nonsense like that.
They don't even own the names "386" or "486" anymore which is why they didn't
name the pentium chip "586".
It sounds as if Moto was never involved in anything like that.

The scuttlebutt on the receiver is that reception is much more limited than the frequencies shown on the display. As a result, I bought an icom IC-2SRA, which will receive up to 1 gig.

Body handling: HTML body converted to readable text

The entire package is worth about $300.00. The Icom R1 suffers from severe intermod and front end overload especially in urban RF environments. The Icom R1 was severly overpriced by Icom. The only good characteristic of this radio is it's concealable small size. The radio can easily fit in your jacket pocket. would not recommend the R1 to be used as someones only scanner. I would recommend it as a second scanner if concealibility is needed.

A new tribander is out from Standard: the 568A. It receives a surprising array of frequencies, including 800-1300MHz. Does anyone know of mods for recovering the interesting parts of the 800 realm? I've checked Oakland and can't get through to AD4HL's BBS (at 615-537-6051).

Does anyone have one of these radios? What do you think?

I'd also like to get a general feeling for what people think about the Standard brand.

In the market,
Mike

>--
>Christopher Seguine seguine@interval.com
>Interval Research Corporation

This is a board that operates with a suitable receiver and
computer, to identify a transmitter that is being used in an
un-identified manner.

By identifying transmitters that are known, this will show
the user which of these transmitters is being used without
proper proceedure. Examples include fleet radio operators
who wish to identify abusers, Amateur Radio operators that
cause malicious interference and other survalence needs.

The unit can quite accurately id individual transmitters,
using the characteristic frequency instability of the first
few milliseconds of each transmission. It is even possible
to exclude that transmitter from keying up repeaters if
desired.

A demonstration that I observed was very impressive. Once
my personal transmitter was logged in, subsequent
transmissions were identified with my name and radio type!
It really works! These guys really have it right!

I'm glad to here this as I just picked one up. However, one of the things I
immediately noticed was the abtrusive antenna. Has anyone had reasonable
luck with a shorter antenna? Any recommendations on a less noticible
antenna?

I have a four month old Bearcat XLT120 scanner for sale. It has 10 banks of 10 programmable channels (100 total channels). 11 Bands (including AIR but no 800MHz). It has search mode, priority scanning, data transmission bypass, lighted display, and uses internal rechargeable battery pack (AC adapter/charger included). In very good shape with only a few minor scratches on the case. $125 + shipping if not in town.

I suspect that you should save your time.

It took me a great deal of tooth pulling to get
my copy way back in 1984-ish. I have a gut feeling
that the USA distributor has long since vanished.
Good riddence, since they didn't seem too interested
in support of any kind.

Plus, I think the whole product line is a dog. The
only reason I use mine is because it is here and
it is almost adequate for monitoring a local repeater.
I don't have the heart to sell it to someone who
actually wants to use it as a scanner.

I do have all of the converters, if you want
to buy them off of me real cheap. I simply have
no use for them considering all the other equipment
I have to do the job these days.

I wonder if it matters or not to use a 9.6 volt supply/charge as
opposed to the recomended 9.0 volts? open voltage on a 9.0 volt
adapter is over 11 volts, wheras the open voltage on the 9.6 supply
is 9.6. I know that open voltage does not really mean anything, but
I would think that a well regulated 9.6 supply would not hurt.?????

SC>The following is the begining of a mini-faq on Motorola VHF/UHF/800mhz
SC>radio systems. Motorola radios are widely used accross the US by the
SC>Goverment, Public Safety services and Businss users due to their high
SC>quality. All specific model and systems names mentioned below are
SC>registered trademarks of Motorola, Inc and the following descriptions are
SC>intended for information purposes only.

SC>If anyone can provide addition information on Moto radio systems or
SC>specific model capabilites please post.

SC>GP-300 UHF 08 mode 08 channel HT
SC>GP-300 UHF 16 mode 16 channel HT
SC>GM-300 UHF 16 channel
SC>
SC>HT-600 VHF/UHF 02/06 channel/may include DTMF
SC> front-panel

SC>P-110 UHF 06 channel
SC>P-200 UHF 06 channel

SC>(Jedi System)
SC>HT-1000 UHF 16 channel / may iclude scan function
SC>MT-2000 UHF 48 channel / top display
SC>MTS-2000 VHF 136-178mHz

the mt2000's are good up to 160 modes.

SC>MTS-2000 UHF
SC>MTS-2000 800
SC>MX-300R UHF 12 channels/black rubber finish (US Govt)
SC>MX-300S UHF 12 channels
SC>MTX-800 800 Trunked - Single System
SC>MTX-810 800 Trunked - Multiple Sytem
SC>MTX-900 900 06 channels/DTMF

SC>(Saber System)
SC>Saber I
this is a basic, 12 channel model
SC>Saber II
typically 48 modes (4 banks of 12 ch each) but i've seen up to 120 modes
SC>SABER III -- typically 120 modes, 10 banks of 12 ch

SC> UHF 72 channels May include DES-XL
SC>(Saber III systems include 6 zones (12 channels each zone), 72 total
SC>channels

SC>Syntor X-9000 32 channels
SC>Syntor XX Mobil VHF 32 channels 100 watts / may include scan

SC>(Astro System)

SC>Expo ??? May include DES

SC>Radius VHF
SC>Radius UHF 02 channels
SC>Radius VHF-Low 16 channels (Can mod to 6 meters)

SC>Mitrek VHF-Low 01 channel (40-50 mHz) (Mobil)
SC>Mitrek UHF 04 channels (25-40 wattts)

SC>Unknown
SC>300S VHF ???

SC>Spectra System

SC>Glossary
SC>DES-XL Data Encryption Standard-XL (Sold under the tradename Securenet)

SC>Best Regards,
SC>bjones@aramco.com

Alan (N7GAD) gave the BBS up a year or so ago. It was just getting to be too much for him to deal with. I think that he passed it on to someone else, I don't know it's currnet status. It was great, but then the net came along.
